UNIX IN THE '90s

The #1 Workstation Memory Vendor Now Supports the #1 Workstation Company

Clearpoint Introduces HP-Compatible Memory

Clearpoint, the only manufacturer of memory for both Hewlett-Packard and Apollo systems, now offers memory 100% compatible with the HP 9000 Series 350/370 workstations. The HPME-93P is backed by Clearpoint's comprehensive support program:

- ◆ lifetime warranty
- ◆ next day repair/replacement
- ◆ 24-hour technical support hotline.

The HPME-93P array board is available in both 4 MB and 12 MB configurations. Using 1 MB DIP technology, the array board brings your system to its full 16 MB/slot capacity.

The HPME-93P is user-installable; no jumper configuration is needed. The HP 9000 Series 350/370 includes built-in diagnostic testing to insure easy installation and a high-speed bus for no-wait state processing.

Memory for the full line of Apollo workstations... Clearpoint's DNXRAM series.

The DNX4RAM, available in 4 MB and 8 MB configurations, is a one board memory solution for the Apollo Domain 4000 series — the DN 3500, 4000, and 4500. Populated with 100 ns fast page-mode DRAMs, the DNX4RAM offers performance identical to Apollo boards.

Harness the full power of your Apollo 3000 series of workstations! The DNXRAM offers 1 MB or 2 MB capacities on a single board. By using 256 Kb ZIP DRAMs, the DNXRAM delivers twice the density per slot.

CLEARPOINT

Please visit us at UNIFORM booth #2532.

Other Clearpoint Workstation Memory Families:

- ☐ APPLE
- ☐ SUN
- ☐ COMPAQ
- ☐ DEC
- ☐ IBM

Call or write for Clearpoint's comprehensive workstation brochure and the Designer's Guide to Add-in Memory.

APPLICATION CRITICAL? HP DEVELOPERS CHOOSE POWERHOUSE®

"... a number of vendors offered bits and pieces of 4GL language technology; only PowerHouse from Cognos had it all."

Michael H. Brown
President, Gerber Alley*

Gerber Alley has built a \$30 million annual business by providing hospitals with a very successful, fully integrated health-care system – THE PRECISION ALTERNATIVE.

When they had to choose an application development environment, they knew they

were betting more than just their business on making the right choice – they were betting patients lives. That's why they chose PowerHouse.

Over 8,600 HP users around the world, including 200 commercial developers, have chosen PowerHouse for their "bet the business" applications, making PowerHouse the most successful development environment on HP.

If PowerHouse applications are critical to your business success, choose PowerHouse on HP.

1-800-426-4667

PowerHouse Partners have written over 300 powerful commercial applications for HP users.

Please send me information about:

- _____ PowerHouse, the HP solution (including a catalogue of over 300 existing commercial applications).
- _____ PowerHouse Partners Program – the best in the business!

Attach business card and mail to: **Cognos Corporation, 2 Corporate Place, I-95 Peabody, MA 01960** or photocopy and FAX to: (508) 535-8241

More than the leading 4GL – the most successful development environment on HP.

Order From Chaos

Let IEM solve your "mess storage" problems with the ultimate mass storage solution.

Our high capacity intelligent tape system for HP 1000, 3000, and 9000 computers offers up to 2.3 GBytes of storage on a single compact 8mm video cartridge tape. Use it off-line for unattended multiple disk backup (up to 11 MBytes per minute) and restore operations, or on-line as a directly connected tape drive (HP 7974 emulation).

The model ET8200-HP will help you make the most of your limited time and space. Best of all, it is **AVAILABLE NOW!**

From IEM, of course.

TrackStar helps Monroe absorb the shock of schedule changes

"We were working on an important development project for a major automotive OEM. The schedule was already pretty tight when we got the word: 'the deadline has been moved up by six months.' That's a lot of shock to absorb, but TrackStar helped us do it."

"TrackStar helped us find the areas where things could be speeded up, and where we needed extra resources to get the job done in time."

Russ Griebel of Monroe Auto Equipment's Advanced Engineering group uses TrackStar to help schedule the work of 60 people. "We had PC scheduling software we liked, but it just couldn't handle the load. With 60 people working on more than 30 projects we needed the multi-user, multi-project capabilities that TrackStar offered."

If you need a system that can help you schedule both your projects and your people, take a look at TrackStar.

FAXLink...

the paperless approach for the HP3000

Now FAXLink delivers in 3 different ways...

1. Directly from a seamless, fully supported HP DESK Interface.
2. Directly from your own programs.
3. Directly from a FAXLink stand-alone environment.

FAXLink supports

- Logging for Shared Billing
- Deferred Sending
- Worry-free Message Tracking
- Automatic Resending
- Security ● User ID's
- Group Sending
- Multi-Line Sending
- Superior Clarity
- Letterheads ● Logos
- A Popular Hardware Interface.

For a limited time. Demonstration software is free.

Announcing...

SUPERDEX™ adds unprecedented data retrieval speed and flexibility to the IMAGE, TurboIMAGE, and TurboIMAGE/XL database environments on the HP3000.

SUPERDEX allows multiple keys in master or detail sets, generic and partial-key lookups, wildcards, automatic keywording and keyword retrieval, transparent field grouping, sorted sequential access using concatenated keys, and dynamic relational queries across multiple fields,

datasets, and databases.

SUPERDEX adds all the features you always wished for in IMAGE, with the flexibility and power of a relational database. It is a natural, compatible extension to IMAGE, using identical intrinsics and requiring only minor program modifications.

So unlock the power in your IMAGE environment. Give **SUPERDEX** a free try today.

* SUPERDEX is a trademarked product name of Bradmark Computer Systems for the SI-IMAGE package developed and implemented by Dr. Wolfgang Matt.

At last...

With PDQ for QUIZ from Tymbabs, you get the best of both worlds: Use QUIZ for efficient prototyping and development, then turbocharge your applications with PDQ for maximum performance.

QUIZ runs fast.

PDQ® for QUIZ™ dramatically improves the run-time performance of reports written in QUIZ, Cognos Corporation's fourth generation programming language. PDQ compiles QUIZ reports into machine language instructions which can be executed directly by the HP 3000. While time savings vary, sites around the world report CPU time and elapsed time reductions averaging 50%, and greatly improved system response when reports are run during the day.

Compiling reports with PDQ is a simple one-time process. No changes to your existing QUIZ code are required, and the compiler is operated by simple commands just like those used with other HP 3000 compilers. Unlike the QUIZ COMPILE command, which only saves a few internal tables, compilation with PDQ produces a permanent program file which you can :RUN at any time to produce your report.

If you use QUIZ, you know there is no more efficient way to get applications up and running and out the door. But once you go into production, you need all the performance you can get. Now you can have the development advantage of QUIZ plus the execution speed of a true compiled language.

The PDQ compiler is available for all HP 3000 CPU models, and presently runs in compatibility mode on Series 900 systems. Call us to order your demo copy today.

Report 1: 36% time savings.
Two-pass report with simple calculations, extensive printed output.

Report 2: 47% time savings.
Multi-pass report with moderate calculations, output in last pass only.

Report 3: 78% time savings.
Multi-pass report with extensive totals, multiple defines, and output limited to one-page summary per pass.

Off We Go Into the '90s

Well, we've made it. Chalk up another decade. Goodbye Reaganomics. Hello One Thousand Points of Light. The '80s certainly ended in a bang, and the outlook for the final chapter of the 20th century looks promising. For the first time in some 40 years, we are entering a new decade where the threat of nuclear annihilation is becoming more remote, and new technologies will foster human potential throughout the world.

On that inspirational note, let's take a look and see what Hewlett-Packard has in store for you in the coming years...

For starters, this month HP will introduce new RISC-based low-end, midrange and high-end computer systems, including new superminicomputers. The announcement is being heralded by HP executives as the biggest in its history. Not a bad way to kick off the decade.

According to HP President, John Young, HP's emphasis will be on technological innovation, total quality control, reduced time-to-market for new products, manufacturing competitiveness, marketing and selling effectiveness. "We exit our 50th year a more dynamic, responsive and competitive organization than ever, and look forward to the next decade with confidence," Young said.

In the '90s, HP will continue to emphasize standard-based systems that work together in cooperative computing environments, are easier to use and have a lower overall cost of ownership.

Sometime in mid-year, HP will introduce the first new products resulting from the HP/Apollo merger. The products will be based on the Motorola 68000 platform. Also, a new chip set will be available in the future as a board upgrade on both the HP 3000 and HP 9000 line of multiuser systems. HP said a version of the chip is nearing completion and customers should expect product-specific details to be announced in the second half of this year.

Also, expect to see this year new multiprocessing capabilities and OLTP (on-line transaction processing) software enhancements. In addition, HP said it has developed advanced CMOS (complementary metal-oxide semiconductor) processors for future release that will more than double the performance level of the company's current high-end minicomputer, the HP 3000 Series 960.

"We can't predict the future with any great degree of accuracy," said Young, "but we've worked hard to prepare ourselves for its multiple variations by building on our strengths and positioning ourselves to take advantage of every opportunity."

Welcome to the '90s.

HOW TO GET EVERYTHING OUT OF A SPECTRUM THAT HP PUTS IN.

EMC's 95X Spectrum Memory for
HP 3000 950/955 Systems.

You saw terrific potential in your Spectrum system when you bought it. The trouble is, to turn that potential into productivity, you need more memory — and the cost of that can add up in a hurry. But today more and more companies are finding out that it doesn't have to.

WHAT'S GOTTEN INTO THE WORLD'S MOST SOPHISTICATED SPECTRUM USERS?

EMC's 95X memory for HP Precision Architecture systems. As the established leader in the HP 3000 marketplace, our commitment to bringing users cost-effective alternatives for memory and disc needs is unsurpassed. We continue this tradition with 95X memory for Spectrum Series systems — available in 16 megabyte capacity boards and backed by EMC's stringent testing procedures and industry-first Lifetime Warranty.

EMC also offers you the depth of support you'd expect from a leader.

Our service centers worldwide keep full spares inventories and have trained Customer Engineers on-call. And, our new full service Response Center gives you the benefits of technical expertise and dial-in diagnostic capabilities 24 hours a day, 365 days a year.

Priced significantly less than any comparable offerings from Hewlett-Packard, 95X Spectrum memory from EMC gives you everything you're looking for. A full Spectrum of performance and value.

DEC TERMINALS WITH MPE/XL

QUERY:

Chuck Lewis (SIG 32/MESS 6): Does anyone have experience using DEC VT320 terminals with an MPE/XL system? How well do they work? What about with full-screen editors, VPlus forms-based packages, etc.? Are there any problems with cursor movement commands, video attributes (i.e., blink, bold, etc.), function key assignment or keyboard layout? VT320s seem to be about half the cost of an HP terminal, so why not use DEC terminals instead of HP?

REPLY:

Doug Shelton (SIG 32/MESS 7): Unfortunately, Hewlett-Packard created its own set of terminal escape sequence, block-mode protocol and Enqack handshaking. These protocols have no relation to the DEC or ANSI terminals I've worked with. Chances are your VT320 wouldn't work at all with MPE/XL's full-screen editor (an optional product, I think, and expensive), I really wouldn't expect it to work with VPlus. We've had success with PC terminal emulators, such as Reflection, Session or SmarTerm 2392, and you can use a PC-based editor, like Brief, for even more powerful editing capabilities.

LASER PRINTER DRIVER

QUERY:

Tom Jacomet (SIG 27/MESS 2): Wanted! Printer driver for HP's LaserJet IID printer. HP doesn't have one for remote printing on its 3000. We use the generic printer driver file TTPC118 that doesn't use status check. For example, if the printer encounters an error such as paper out, the system doesn't know it, and you lose the print job.

How To Use ARIS/BB

Subscribers to *HP PROFESSIONAL* can call up our online bulletin board and log into ARIS/BB, our Automated Reader Information Service. In ARIS/BB, you can download programs from this publication, communicate with our editors, request a change of address, find additional information about advertisers, order books and back issues, check the guidelines for submitting articles, take a peek at our editorial calendar for the year and communicate with other HP users.

To log in, you'll need your subscription number from your mailing label. Set your terminal to seven data bits, one stop bit and space parity, or eight data bits, one stop bit and no parity. Set your terminal emulation to VT100 and dial:

(215) 957-1000 - Pennsylvania
(818) 577-9100 - Southern California
(415) 873-2135 - Northern California
(617) 863-5010 - Massachusetts
Baud rates: 300, 1,200 or 2,400.

After the CONNECT hit Return two or three times.

The ARIS/BB symbol appears at the beginning of each program that's downloadable. Use these recommendations at your own risk. Professional Press is not liable for any damages to your system that might be caused by the hardware, software, programs or procedures discussed here.

XMODEM and KERMIT are available.

SIG Identification

The SIG categories referenced in this month's ARISTALK are:

26 Communications/Networking
27 LaserPrinters/Font Cartridges
32 MPE-MPE/XL
49 Databases/4GL
92 User Group Announcements

REPLIES:

Doug Shelton (SIG 27/MESS 3): I've heard a nasty rumor that HP has omitted the ESC? status request sequence from the LaserJet IID's command set. If this is the case, you won't be able to have the HP 3000 do any software status checking. I know the LaserJet II and LaserJet 2000

respond correctly, but the 2000 requires "robust x-on" to be enabled. One alternative is to connect the printer to an ADCC or modem ATP port and configure the port as TYPE 32 SUBTYPE 15. This causes the system to monitor the RS232 status leads and stop the spooler if certain pins are not held high. Although you don't get complete status checks, you keep your printouts from becoming a pile of bits on the floor if the printer is powered off or its cable disconnected. Another alternative is to get a copy of HP's Workstation Configurator program. This program (once expensive, but now provided free by HP), allows you to customize your own termtype files.

Jon Broz (SIG 27/MESS 5) By the end of 1989, there should have been a special I/O board for the LaserJet IID that provides status checking support.

It should provide the same status checking that HP 3000 computers use with other LaserJets and serial printers. Check with your HP sales representative for further details, or call the HP Personal Peripheral Assist line at (208) 323-2551 for any post-sales support questions.

These queries have no replies. If you can respond to either of them, please dial up ARIS. We need your input. —Anne Schrauger.

QUIZ

QUERY:

Mike Bennett (SIG 49/MESS 2): Does anyone know of any routines to produce standard deviations using Cognos's Quiz?

GC/MS/RTE

QUERY:

Richard McMillin (SIG 92/MESS 4): Are there any HP-RTE/A or RTE/6 users doing GC/MS? We have several systems in operation using HP 1000s. ■

Transforming your HP 3000 data with speed is elementary.

Allow your end user the speed and versatility of a complete information access tool. **DataExpressSeries™** provides MIS security and control, while extending to your end user new levels of self reliance and productivity. It's designed to ignite powerful solutions to all your HP 3000 data interchange needs. It's an easy system to learn. And it's easy to use.

As your link to HP 3000 data, DataExpressSeries accesses IMAGE, KSAM, MPE and SD files, downloading to PC applications such as spreadsheet, word processing and database. **DataExpressSeries** is designed to complement all major PC software, including Lotus 1-2-3, Excel, and Word Perfect to name a few. The **ReportDesigner** module has been engineered so that your end users can create sophisticated, customized reports. And your staff can generate full-color, two and three-dimensional graphics with the **GraphicDesigner** module.

With DataExpressSeries modules, you have a powerful information center that works with your environment. Our **Interfaces** allow you to take advantage of your investment in PowerHouse, HP Dictionary, RELATE, and Omnidex.

Call us today! Let's have a conversation for action, for service and for productivity. **800-87-IMACS.** We TAKE data seriously.

INDUSTRY WATCH

Bill Sharp

What Does HP Have In Store For Us In The '90s?

The Decade Ahead

Just for a moment, stop and think about what has happened in the computer industry during the past decade. Ten years ago, workstations and PCs didn't exist, UNIX was strictly for nerds, and networking was something you did around the coffee pot. With that in mind, what hope do we have of projecting several years into the future and predicting accurately about HP and the computer industry? Not much. But let's take a stab at it anyway.

Minicomputers

Minis have been the great fast fade fad of 1989. Nobody knows who started this non-buying craze, but it's been very popular. In marketing terms this is explained as the "leveling off of market growth." The sales slump has hurt all minimakers, but HP has fared much better than the others because it had workstations, PCs and peripherals to keep business steady.

According to Dick Watts, marketing manager for HP's Computer Products Sector, wild growth in minicomputers is over. Rather than being the anchor in large terminal-based systems, minis will evolve into two specialized roles.

Their primary function will be as dedicated high-end servers on a network, providing specific applications to smaller workstations or PCs. These applications will include time-shared processing, real-time functions and special services such as online transaction processing (OLTP). These applications can't be well served by standalone systems lacking shared databases.

The other role will be to provide high-performance computation services on the network. When your workstation or PC can't handle a number-crunching job effectively, your system will pull in extra computation power over the network from a mini tucked away out of sight. Watts sees minis evolving into many such specialized applications.

Workstations

Workstations are the current stars of the computer marketplace. While minis slump and PCs are slowing down, workstations are flying along, and HP is doing well in the market. Watts attributes workstation growth to their rapid rise in price/performance. Manufacturers have been extending workstation power and flexibility both up into the mini range and down into the PC range in recent months.

Mips ratings of the more powerful workstations now occupy ranges where even the most dedicated users can only run systems at peak power for brief periods of time. At least for the

moment, there's a limit to the number of mips one person can meaningfully use. Workstations will concentrate on what they do best, providing high-performance, leading-edge applications platforms for graphics and other performance areas. Workstation users seek a competitive edge in grabbing and analyzing new data.

The next wave of workstations will concentrate less on thundering performance that far exceeds your ability to use it and more on providing networking capabilities to allow you to take full advantage of all the power in place.

Personal Computers

PCs have been hot stuff for more than eight years now, numbering at least 25 million and still going. Growth is leveling off (10 percent per year), but HP's share of the market is growing — finally. Watts freely admits that HP's early attempts in this market "missed the mark," because HP failed to understand the role of standards or distribution channels in the PC marketplace.

HP learned its standards lessons and has adhered closely to the model of the plug-compatible PC that uses off-the-shelf, shrink-wrapped software. Over the past 18 months, HP has also learned its distribution lessons. HP's PC volume is

high and dealer sales are the name of this game.

As a result, HP PC sales growth is well ahead of the industry, growing at 30 percent, says Watts.

Will PCs get more and more powerful?

Does the sun shine in California? Both PC and workstation manufacturers will continue to cram more of what you love them for into each and every box — don't lose any sleep worrying about this. However there will be some long-term changes in these beasts that will forever alter their nature and probably yours.

Watts sees two classes of computers emerging in the years ahead. PCs, says Watts, will remain strictly plug-compat-

Why ORACLE? So you don't get trapped.

Why ORACLE®? Because older "productivity" software – like PowerHouse – traps you in the past. Escape with ORACLE into the computing environment of the 1990s.

Escape the trap of proprietary languages and poorly integrated products. ORACLE products use industry-standard SQL and are fully integrated to give you a complete MIS solution.

Escape the trap of older command-driven interfaces. ORACLE tools feature a modern, customizable user interface with pop-up and pull-down menus, and a powerful screen-painter for faster development and more user-friendly applications.

Escape the trap of virtual terminal sessions and file

transfers. ORACLE fully utilizes your network, yet keeps the network invisible to your users. For example, ORACLE applications running on a PC can transparently access data on your HP 3000.

Escape the trap of waiting for vaporware. ORACLE offers powerful, flexible RELATIONAL DBMS technology today. Like online database modification, ad-hoc query capability and customized views of your data.

Escape all the hardware traps. ORACLE's true

portability gives you complete hardware independence.

With ORACLE, your applications, your data, and your data definitions run on the HP 3000, HP 9000, HP Vectra and over 80 different hardware platforms. And ORACLE will also run on your future hardware platforms.

Why ORACLE? Because you're ready to escape the traps of the 1980s with the technology of the 1990s. Call 1-800-345-DBMS ext. 0966 to register for the next, free ORACLE data management conference near you.

ORACLE®
COMPATIBILITY • PORTABILITY • CONNECTABILITY

HP/PROF

ible and use shrink-wrapped software. They'll become increasingly easy to use. Watts calls these "pure vanilla, industry-standard machines." They will be like today's PC only in that they will be strictly based on industry standards — capabilities will change.

Also, they will require less thought to use, like a telephone, to paraphrase HP's Joel Birnbaum, vice president and general manager, Information Architecture Group. However powerful or tiny they become, Watts argues there will be this class of pure vanilla computers, available at low prices, whether we call them PCs or not.

A second class of computer will follow the pattern of today's workstations, using industry standards up to a point, then diverging to allow designers room to innovate, providing levels of performance and/or capabilities not available in the other class of computers. Naturally, the level of innovation must always exceed that of the PC class, or these generally more expensive products will fail. So the innovation level will be, as today, a continually moving target. These computers will require more knowledge of the user, as they do today.

Precision Architecture

Can a single vendor develop a proprietary architecture fast enough to stay ahead of the rest of the marketplace? No, says Watts, but by signing up strategic alliance partners, they can keep up and offer capabilities not available elsewhere. HP now has those partners, so look for PA to fit into smaller systems soon, but not PCs. Because a PC is an industry standard architecture, by definition PA can't be in a PC — you'd have to call it something else. But Watts says PA can fit into the PC price range. Stay tuned.

Networking

Got those saws handy? Let's climb out on a limb. Remember all those folks in recent years saying networking had ar-

rived? They were early, but the '90s really will be the decade of networking.

When you have a computational job to do, your system may do all the work itself, or send the job to Mary's workstation sitting idle while she's at lunch, or run it on the computational server off somewhere on the network. You won't know and won't care because newer, more sophisticated networks will take care of it.

Integration of applications much like what you can have today with HP's NewWave gradually will become available over networks, enabling you to integrate various parts of your work and other people's work. You won't need to worry about what software was used, or what system. Rather than wasting the computational capacity of Mary's workstation while she nibbles nachos, that system can hum along on your work until she needs it again.

Network Computing System (NCS), the Apollo product that allows this kind of work sharing to take place over the network, is the first of these products. Watts notes that Apollo's NCS now has 150 licensees in the industry, placing it "a short step to getting it adopted as an industry standard." Look for NCS and its offspring to play a major role in how networking evolves.

Products like NCS and the recently announced Team Computing products from HP are the first wave of this new networking evolution. During the next 10 years, you'll learn to assume these capabilities. They will be standards underlying all systems across the industry. Fiber optics will likely replace wired communications to get the information volume up to where these systems will require it.

Operating Systems

Adhering to standards and functioning on the network will be required to exist in the marketplace, but adding functions beyond these will become easier. This will mean that using both UNIX and MPE XL will be possible for example, providing HP decides to expend the resource to make it happen. MPE XL, or for

that matter, many other specific capabilities, could exist within a UNIX shell.

The message here is that operating systems will become less visible as time

Remember all those folks in recent years saying networking had arrived?

goes on. As with other detail issues, you'll tend not to be aware of them. Multiple operating systems will be the norm five to 10 years from now. But the largest of these, at least for the present, will be some version of UNIX. Watts points to the momentum of students, applications software and entrenched users in support of UNIX all favoring its adoption industry wide. Whose UNIX? It probably doesn't matter a whole lot. The several versions are irritatingly different, yet they adhere to many of the same standards. Look for the furor to die down, and another standard to emerge.

Will HP Stay Strong?

The past months have seen significant troubles for nearly all of HP's competitors. Wang, Prime, Honeywell and NCR have taken it on the chin, and even IBM and Digital have stumbled. Is HP immune from these problems? "No," says Watts. "We are subject to all the same external forces. If we are hit by these things, they will affect us. We will make sure we run a very tight ship."

Watts says HP's fortunes will determine how quickly it can implement its vision. "HP seems to have its act together," he says. "I don't think we are about to fall off any cliffs. We have a strategy that has the user in mind, we understand the shifts in the market and are well positioned to take advantage of that. Execution will be the part we will have to watch closely." ■

Is there really a difference between one accounting system and another?

On the surface, most accounting software appears to perform the same functions. Offering the same bells and whistles. But there is more to investing in a major accounting system.

We know. We're Collier-Jackson. Seasoned veterans. We formed a strategic alliance with Hewlett-Packard in 1976. And today our accounting software is among the most popular ever written for HP's Classic and Precision Architecture.

The product of all that experience?

World Class Series™ from Collier-Jackson.

We've taken advantage of borderless integration and express navigation in our General Ledger, Accounts Payable, Accounts Receivable, Fixed Assets and Purchasing software. All working individually or together. Designed to run even the most sophisticated company operations.

Our World Class Series includes the award-winning 20/20™ spreadsheet from Access Technology. Allowing you to select specific data for analysis. Quickly.

Other productivity tools include PC-to-host links and a powerful report writer. And our World Class Series Payroll and Human Resource software dovetails. Perfectly.

But the biggest difference goes far beyond. As part of CompuServe, an H&R Block company, we have the resources to take you through implementation and training. Right into tomorrow. With a commitment to long-term relationship building. That's world class, too.

When you look at it this way, it's what really separates one accounting system from another. Call us now at 813-872-9990 and discover the difference.

CompuServe
Collier-Jackson

Our General Ledger, Accounts Payable, Accounts Receivable, Fixed Assets and Purchasing software work individually or together. Easily. With minimal MIS support.

Our Collier-Jackson hotline is available around the clock if you have questions.

The award-winning 20/20™ spreadsheet from Access Technology lets you target specific data for analysis. Quickly.

Collier-Jackson has been developing accounting software for medium-to-large companies for more than 14 years.

World Class Series Personnel and Payroll software dovetails perfectly with our accounting software.

HP Unveils NewWave Office

Key Foundation For Office Computing In '90s

In a press conference from New York City Tuesday Nov. 28, Hewlett-Packard unveiled its office-systems strategy and vision for office computing in the '90s.

Called HP NewWave Office, HP President John Young said the technology is a "set of services" rather than a product.

According to Young and other top HP executives, HP NewWave Office (NWO) is an integrated office system that makes it easier and faster for people to get information they need and act on it.

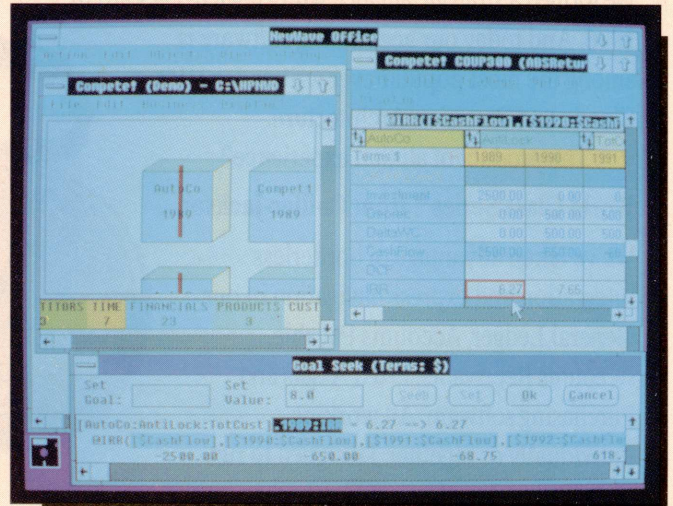

Based on industry standards and the client-server model, HPNWO reduces technological barriers to information sources allowing users to integrate systems and applications

from multiple vendors. HP NWO fully incorporates existing applications while also providing a well-defined migration path from current applications to client-server applications.

"Information is a powerful weapon," said Young, "it is the key to becoming more productive...people today want to be able to retrieve information from anywhere on the corporate network."

With HP NWO, users will be able to better manage, store and retrieve information from a variety of forms and media.

For software developers, HP NWO offers a full set of programming tools and industry-standard application-programming interfaces to reduce application-development

HP NewWave Office allows users to access and integrate information from different applications in one environment.

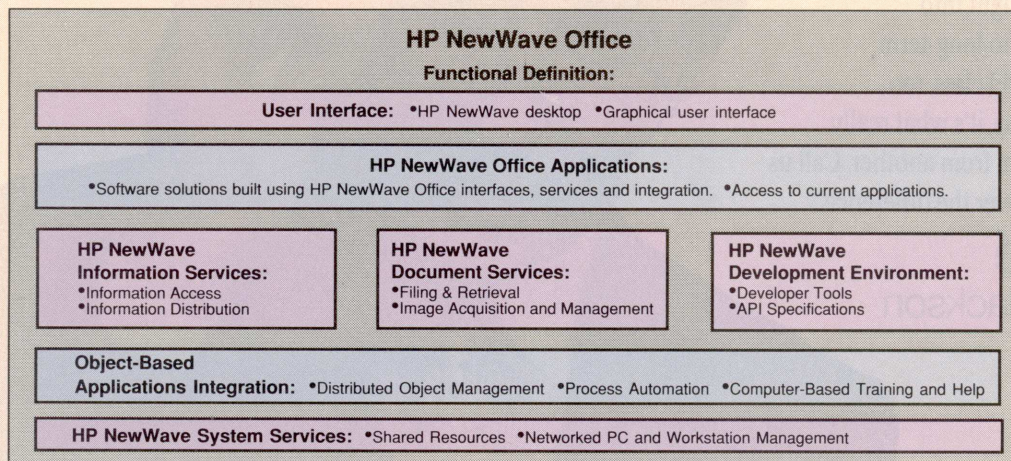

time up to a factor of four or greater.

Integral to HP NWO is an object-based integration capability, a technology developed by HP that enables information to be shared and automatically updated across applications, even if they

weren't designed to work together.

HP NWO capabilities are available for MPE V or MPE/XL, HP-UX and OS/2. HP NWO for HP-UX is the industry's first comprehensive client-server offering for UNIX operating systems, according to HP.

"Our vision is that with products like HP NewWave Office, computers will become catalysts — rather than barriers—to timely actions and decision making," Young said. "Organizations are empowered to transform their information resources into tools for competitive advantage. With HP NewWave Office, HP advances into an industry leadership position in cooperative and PC integration," he added.

Massive Storage

2.2 GBytes Mass Storage in a single, compact cartridge about the size of a deck of cards for HP 3000, 1000, and 9000 computers

Echo 4920

- ▼ High-Capacity, Cost-Effective Tape Backup
- ▼ Up to 2.2 GBytes on a Single 8mm Tape Cartridge
- ▼ High Performance – 11MB per minute transfer rate
- ▼ State-of-the-art Helical Scan Technology
- ▼ Supports HP 3000, 1000 & 9000 Computers
- ▼ Emulates HP's Disk and Tape Devices
- ▼ Ideal for Journaling, Archiving, Backup, Restore and Software Distribution
- ▼ Operates either "Off-Line" or "On-Line" using industry standard backup utilities
- ▼ No CPU required for Backup or Restore

BERING

246 East Hacienda Avenue
Campbell, California 95008
800/237-4641 408/379-6900

▼ More Memory at Less Cost

The Bering EconoPac Winchester Hard Disk subsystems offer high performance/value for primary storage needs. Available in a variety of capacities from 149MB to 673MB, EconoPac performance drives provide a complete line of high capacity, mass storage solutions for all Hewlett-Packard computers.

By supporting multiple operating systems and existing applications, HP NWO protects current investments, allowing customers to build on their existing systems and expand them as needs change. Users can access HP NWO services across MPE, OS/2 and UNIX systems from any industry-standard 80286, 80386 or 80486-based PC, UNIX-system workstation, Apple Macintosh or terminal.

Users also choose from a variety of software, including all MS-DOS and Microsoft

Windows applications and existing applications that run on the MPE and HP-UX operating systems, which have more than 3,000 applications available.

HP NWO prices range from \$1,300 for a four-user license to \$84,210 for multi-user server license, depending on the services purchased and the size of the system. Customers can choose between user-based and system-level pricing. —Tom Halligan, Managing Editor

HP Consolidates And Enhances Support Services For Systems And Workstations

SuccessLine And ApolloLine Programs Kick Off The New Year

Hewlett-Packard has entered the 1990s by introducing SuccessLine, a new on-site hardware support program and ApolloLine, an enhanced version of the hardware and software support that Apollo customers received before HP acquired the company.

HP SuccessLine Service simplifies customers' options for support because systems, workstations and personal computers now have the same service programs. Enhancements offered to all support customers at any service level include work-to-completion where HP customer engineers remain on-site until all problems are resolved, no travel zone charges to customers within 200 miles of any of the 400 HP offices in 90 countries, and an assigned account representative for all support customers.

The following service

level options are available through SuccessLine:

1. Priority Plus — calls are answered within four hours, 24 hours a day, seven days a week.
2. Priority — four hour maximum response time, but the hours for service calls are limited to 8 a.m. to 9 p.m. five days a week.
3. Next Day — a response by the next business day.
4. Scheduled — once a week service.

In the United States, coverage times for Next Day and Scheduled support are 8 a.m. to 5 p.m. Monday through Friday.

ApolloLine also offers work-to-completion and no travel zone charges within a

The HP 9000 Model 834CH is an HP-PA-based workstation that operates at 14 mips.

HP 9000 Model 834CH Workstation Performs 2-D

Software Option Provides Instant Ignition

The newest high-performance graphics workstation from HP is the HP 9000 Model 834CH. Operating at 14 mips (2.02 MFLOPS), the new HP-PA-based workstation comes standard with 8 MB ECC RAM, a 19-inch color monitor driven by the integrated "CH" 2-D color graphics, keyboard and mouse.

The system has the ability to connect up simultaneously to seven human-interface devices, such as a graphics tablet or knob box. It also includes an expansion slot for increasing system capabilities. The Model 834CH system's RAM is expandable to 48 MB.

HP's new preloaded software option has the system software loaded on a 304-MB hard disc and the X Window System preconfigured to provide instant productivity. When a user turns on a Model 834CH equipped with the new option, a login screen based on OSF/Motif and the X Window System appears and enables work to begin immediately.

The software option includes HP-UX, X Version 11, OSF/Motif, NS/9000 and NS/ARPA networking services and the Starbase Graphics Library. In its standard configuration, the HP 9000 Model 834CH is available for \$22,500.

200-mile radius for customers with Apollo workstations. The software support segment of ApolloLine is offered from the Chelmsford Response Center, but other HP Response Centers can be reached through linked databases so that problem resolution can continue around the clock, around the world.

ApolloMax is a support

option for workstation customers who want service within four hours. Service hours are from 8 a.m. to 8 p.m. five days a week. An online information access system provides a news page and an information retrieval system. —Peggy King, West Coast Editor

Rewritable Optical Drives for Hewlett-Packard Computers with HP-IB Interface

Set Your Sights on Optical – 650MB in One Small Cartridge

Model 7600 Rewritable Magneto-Optical Disk Drive

- ▼ Huge 650MB capacity per compact cartridge
- ▼ Quick, random access to large amounts of data
- ▼ Convenient, removable 5.25 inch cartridge
- ▼ Perfect for high security – take it with you or lock it up
- ▼ Increase capacity by adding a cartridge
- ▼ Economical archival storage with "online" accessibility
- ▼ Very rugged and easily transportable
- ▼ Easily installed, uncomplicated to use
- ▼ Very reliable (head crashes are impossible)
- ▼ Long-life media (10-year minimum)
- ▼ No periodic media reconditioning required
- ▼ Available for HP 9000, 3000, and 1000 computers

The HP 75000 System 10 provides a total package for data-acquisition applications.

Hewlett-Packard Offers Data Acquisition System

HP 75000 System 10 Collects Data Without Programming

HP has introduced the HP 75000 System 10, a data-acquisition system that doesn't require programming to collect data and provide results. The system has the necessary measurement hardware and menu-driven software to attach to a PC. For a complete solution, a PC/printer option is available to provide the user with an HP Vectra PC and an HP QuietJet printer.

Applications for the HP 75000 System 10 include mechanical, facility monitoring, biological, physiological, energy research, chemical and material test. Included in the system 10 package are a 5 1/2-

digit multimeter and a thermocouple-relay multiplexer that make accurate temperature measures on up to 16 thermocouples. A quad 8-bit digital I/O card, built into the system 10, allows the system to control devices or sense whether they are on or off.

An HP 75000 B-size card-cage contains five empty slots that can be used with a variety of other plug-in measurement cards. Additional cards will be installed at the factory if they are ordered simultaneously with the System 10.

The System 10 is \$5,750. The PC/printer option is an additional \$4,650.

HP First To Offer FDDI Network-Controller Boards

Data Network Based On ANSI Standard

HP, through its Apollo Division, recently became the first workstation supplier to introduce fiber distributed-data interface

(FDDI) network controller boards based on the ANSI standard.

FDDI is a high-speed data

network with the capability to support up to 200 Mbits per second — more than 10 times the speed of commercial networking products.

The new controller board will be available initially on the Apollo Series 10000 personal supercomputer that, with processing power of up to 100 million instructions per second (mips), will allow users to take full advantage of the FDDI local area network's (LAN) high bandwidth.

The HP/Apollo environment will use FDDI as a backbone network for high-speed peer-to-peer workstations and servers. It will use FDDI to interconnect subset LANs, which are part of large enterprise wide networks. FDDI backbone networks eliminate bottlenecks and contention problems.

Apollo Provides Island DTP On Workstations

Tools To Be Integrated With OSF Motif

Apollo has announced iWrite, iPaint and iDraw, an integrated family of professional productivity tools from Island Graphics Corp. (San Rafael, CA), now available on Apollo personal workstations.

The tools provide Apollo users with flexible desktop publishing tools that take advantage of networked-workstation capabilities. They will be integrated with OSF Motif, the Open Software Foundation's user interface, and will be accessible through Apollo's Knowledge Broker, a hypermedia documentation application.

FDDI also provides a front-end network solution, allowing high-performance workstations to connect directly to the network's full bandwidth.

The HP FDDI implementation also will support Station Management (SMT), an integral part of the FDDI standard that allows controllers on the network to communicate with each other, track network events and provide network administrators with pertinent data and functions. HP will provide SMT software with each FDDI configured workstation. Because the HP station management software is downloadable from the host processor, any future SMT changes can be implemented without hardware modifications.

iWrite is a composition program that allows users to perform WYSIWYG word processing, importing rasters from iPaint and vector graphics from iDraw. iPaint lets users edit scanned images and create art work that can be imported into iWrite and other composition programs. iDraw generates vector-based graphics that can be sent to PostScript devices and transferred to iWrite and other composition programs.

iWrite is priced at \$595; iPaint and iDraw together will be \$495.

Reflection® runs through more PC-to-HP networks

Choose the PC network that best fills your company's needs — *then* choose **Reflection** for flawless emulation of Hewlett-Packard, DEC, and Tektronix terminals.

When you install Reflection, your PC becomes a dynamic workstation with features far beyond terminal emulation. Features including multitasking, dependable file transfer to HP, HP-UX and VAX/VMS hosts, a programmable command language, complete keyboard remapping, and a sophisticated PC file backup and restore function.

Reflection 1 PLUS (\$349) emulates HP 700/92, 700/94 and VT102 terminals.

Reflection 1 PLUS for the Macintosh (\$299) provides HP 2392A emulation.

Reflection 3 PLUS for the Macintosh (\$399) emulates HP 2393A graphics and HP 2392A terminals.

Reflection 7 PLUS (\$449) emulates HP 2627A color graphics and Tektronix 4014.

Reflection reaches even more networks and hosts with Reflection Complements, including:

TelnetManager (\$99), adds Telnet protocol to Reflection on your PC for high-level terminal emulation to hosts on TCP/IP networks;

3270 FileExchange (\$99), for transferring files to IBM mainframes;

MNP SoftModem (\$79), a software solution for error-free communications.

Call toll-free to order Reflection from Walker Richer & Quinn, the connectivity specialists.

QIC Members Ship 525-MB Tape Drives

Technology Advances Increase Storage

Four companies are shipping evaluation units of new quarter-inch data cartridge tape drives that store 525 MB of data, more than a three-fold increase over current products.

The four companies, members of Quarter-Inch Cartridge Drive Standards Inc. (QIC) are Archive Corp., Mountain Computer, Wangtek Inc. and the Tandberg A/S Division of Siemens.

QIC is an industry association that encourages and promotes widespread use of

quarter-inch data cartridge tape drives and media.

The new subsystems are compatible with a variety of computer systems as well as current QIC-compatible products. The drives use a DC600-class cartridge and meet the 5.25-inch form factor.

Contact Quarter-Inch Cartridge Drive Standards Inc., 311 E. Carrillo St., Santa Barbara, CA 93101; (805) 963-3853.

PRISM CPU Increases Performance On Apollo 10000

RISC CPU To Double The System's Processing Power

Through its Apollo Division, HP unveiled a program to increase the overall system performance of its Series 10000 personal supercomputer, including a new fully compatible RISC CPU that will double the system's processing power.

Over the next year, every

major component of the supercomputer-class, multi-processing Series 10000 computer will receive a substantial upgrade. A new PRISM CPU will double computer power, from 22 mips to 44 mips (12 MFLOPS) per processor; parallelizing and vectorizing compilers will in-

crease system performance two to four times; HP will make available a specialized software-development environment for parallel programs and an interactive scientific-software-computation and visualization environment;

main memory capacity will be expanded by a factor of four; disc capacity will be improved by a factor of six; and local area networking bandwidth will increase by a factor of 10.

HP, Ultimate Sign \$100 Million-Plus Agreement

Ultimate To Distribute Pick-Based Solutions

HP and The Ultimate Corp. (East Hanover, NJ) announced the signing of a letter of intent to market HP minicomputers. Potential value of the multiyear agreement could exceed \$100 million.

Under the anticipated agreement, Ultimate will become HP's exclusive dis-

tributor of solutions based on the Pick operating system. Ultimate will market to its dealers and end users the full line of HP 9000 Series 800 multiuser minicomputers.

The computers will run HP-UX with Ultimate's ULT/ix Pick-to-UNIX software bridge.

Electronic Publishing Packages Offer Solutions To Apollo Users

The Publisher, WordPerfect Available On Workstations

Through its Apollo Division, Hewlett-Packard has announced the availability of two electronic-publishing packages on the Apollo Series 3500, Series 4500 and Series

2500 personal workstations.

The two solutions are: The Publisher, ArborText Inc.'s publishing package, and WordPerfect, WordPerfect Corp.'s word processing system.

The Publisher electronic publishing system, priced at \$4,500, is designed to support SGML, Q CALS recognized standard.

WordPerfect 4.2 for Apollo workstations, priced at \$595, includes such features as snaking and parallel columns, line numbering, macros, table of authorities and a rectangular block/move feature.

Correction

In the August issue of *HP PROFESSIONAL*, the article "Need More Memory" reported on page 32 in the third paragraph that 4 MB of memory is the limit that can be added to the HP 3000 Series 37. According to EMC, it can add up to 8 MB of memory for the Series 37.

Also, in the table on page 37, under EMC Corp., the "yes" answer to the Assembly Subcontracted question was incorrect. EMC Corp. does not subcontract work. EMC Corp. owns and operates its manufacturing facility in Canovanas, Puerto Rico.

For more information on EMC Corp. products, call 1-800-222-EMC2 (MA residents call 1-508-435-1000, ext. H938); in Canada, call 1-800-543-4782.

HP Professional regrets the errors. —Tom Halligan, Managing Editor

MAESTRO Squeezes Every Drop of Throughput From Your Batch Job Processing

Getting the most out of your batch processing while continuing to do it manually can be like squeezing water from a stone. But with MAESTRO's automated approach you'll increase your batch job throughput by an average of 35-50%.

MAESTRO allows you to realize your full production potential because it reacts instantly to a job completion, reply to a prompt, job termination, or any other significant event. This split-second response is impossible for even the most diligent operators, because they're often busy with other things like loading paper. MAESTRO's attention to detail also minimizes costly errors.

MAESTRO automatically manages a variety of tasks which are usually performed manually, such as integrating user job requests, scheduling production, preparing job streams, and documenting job status. In fact, MAESTRO is

so efficient it gives you the potential to run production completely unattended. Even if you have multiple CPU's.

We could go on and on. About saving computer time. Ease of use. Cutting personnel costs. And much more.

But all it takes is one look at MAESTRO in action. Call us today at (408) 245-3000 for a 30-day demonstration or to find out more.

"For a permanent solution, it's Unison."

AutoCAD Supported On SCO Xenix, UNIX

*PC-Based CAD Package Support
On PC-Based Workstations*

Santa Cruz Operation Inc. (SCO) announced that AutoCAD, a PC-based CAD package, would be supported on PC-based workstations running the SCO Xenix and SCO UNIX System V/386 operating systems. The SCI Xenix and SCO UNIX version of AutoCAD will be available through Autodesk dealers.

AutoCAD Release 10 for SCO Xenix and SCO UNIX systems is available for \$3,000.

Microsoft, HP To Cooperate On Printer Fonts

*MS OS/2 Presentation Manager
Device Driver Supports Intellifont*

Microsoft Corp. and HP announced that they are working to provide support in a future MS OS/2 Presentation Manager device driver for Intellifont, the font-scaling technology chosen by HP for its PCL printer language.

This will expand Presentation Manager's scalable font dexterity to provide WYSI-WYG capabilities with current and future printers in HP's LaserJet printer product line.

In a separate announcement, Microsoft described its agreement to license Apple's outline font technology as its standard font format for OS/2 Presentation Manager.

The solution for linking scalable printer fonts with the Presentation Manager display is to incorporate the device-specific printer fonts into an enhanced printer device

driver. Upon installation of this printer driver, the fonts are made available to the system for use by the display when an application is composing a document intended to print on this printer. A similar enhanced printer device driver is being jointly developed by Microsoft and HP, incorporating Intellifont, a font rasterizer that will be used as part of the recently announced PCL5 language from HP, into the OS/2 Presentation Manager device driver for HP printers. The driver brings HP's printer-specific font format to the Presentation Manager screen.

Cadre Technologies Joins CASEdge Program

*Cadre Now Supports Teamwork
On HP And Apollo Workstations*

As part of a new marketing agreement, Cadre Technologies (Providence, RI) took over the sales and distribution of HP Teamwork on Nov. 1, 1989. HP's Logic Systems Division sold and supported an HP version of Teamwork from Cadre Technologies since October 1986. In Japan, Yokogawa HP (YHP) will continue to sell and support its kanji version of the product for the Japanese market.

Teamwork, is a front-end (Analysis and Design) tool for Computer Aided Software engineering on HP 9000 Series 300 workstations and on the Apollo division's DN series.

Customers who purchase Teamwork for HP 9000 Series 300 from Cadre will get support from Cadre. Customers who have purchased HP Teamwork and a support contract for it from HP will continue to get support and updates from HP.

The two companies have a new way to work together now that Cadre has become a member of HP's CASEdge program. With the CASEdge program, HP provides the integration tools and platform to incorporate Cadre's analysis and design tools as part of a customized software development environment. — Peggy King, West Coast Editor

Top Hat Systems Now Authorized Software Supplier

Software Firm Serves Restaurant Industry

Hewlett-Packard has accepted Top Hat Systems Ltd. as an authorized software supplier for the restaurant and food service industry.

Top Hat Systems Ltd. develops and markets IBM PC compatible software to meet the needs of the restaurant and food service industry, including table service restaurants, fast-foot outlets, cafeterias, hotels, resorts, casinos, cruise lines, private clubs and school food service. In all cases, the software is designed to fill the needs of both single establishments as well as multiple outlet operations such as chains

and school districts.

CIRCLE 104 ON READER CARD

HP Introduces Object-Oriented Portable Software Toolkit

HP, through its Apollo Division, introduced the HP Text Management Library, an object-oriented, portable software toolkit.

The kit allows software developers to produce text-based applications more easily and efficiently than currently is possible with conventional text-manipulation tools. The product's source code has been placed in the public domain and is available through the MIT X Consortium.

HP Text Management Library acts as a set of reusable application building blocks, which reduce development time and result in faster time-to-market for software products. Its library allows software developers to build interactive applications that can mix fonts and character sets and present text on both the screen and hardcopy devices.

HP Text Management Library supports UNIX, X Window System from MIT, PostScript and other operating systems and graphics environments. The source code is available for \$110, which includes media and documentation. It can be ported and compiled on any standard hardware platform.

Plug-In Cartridge Delivers PostScript Compatibility

Pacific Data Products announced PacificPage, a PostScript language compatible cartridge for HP LaserJet Series II printers.

When plugged into the cartridge slot of a LaserJet Series II, PacificPage gives the user immediate access to 35 Apple LaserWrite NT equivalent font families in unlimited point sizes. It provides all PostScript-Version 47 capabilities, including reversed text, scaled fonts, text rotation, and complex high resolution graphics. No software, cables, or circuit boards are required. Only 2 MB of total laser printer memory are needed.

Priced at \$695, PacificPage is

compatible with IBM and IBM-compatible computers. It also is compatible with all major applications programs which support PostScript output including Ventura Publisher, Aldus PageMaker, WordPerfect 5.0, WordStar 5.5 and 2000, Word 5.0 and Harvard Graphics.

Contact Pacific Data Products, 6404 Nancy Ridge Dr., San Diego, CA 92121; (619) 552-0880.

Facer Modifies CIA For XL Machines

Facer released XCIA, a version of the CIA system performance product that will operate under MPE XL without accessing the Measurement Interface.

Facer is currently working with HP to produce Architected Interface access to the MPE XL Measurement Interface. The release of these Architected Interfaces will be based on the 2.1 MPE XL platform due for release in Spring 1990.

XCIA displays process and file information so that users can determine process CPU usage, what users and processes are accessing a file and what files a process is accessing. It

also allows queues to be changed dynamically, allows full access to the Command Interpreter, and has the full CIA filtering system to "zoom in" on particular processes.

The product retails for \$2,000 and will be credited to the price of the CIA/XL product. Contact Facer, P.O. Box 9802-231, Austin, TX 78766; (512) 440-8488.

Insight Development Offers Connectivity Products

Insight Development Corp. has announced the availability of MacPrint version 1.2, Print-APlot 1.1 and LaserControl 3.3 device management software for the Hewlett-Packard Series IIP laser printer. These software packages allow the printer to be used with additional computer systems and application packages.

MacPrint 1.2 is a complete device management software system for the Macintosh. It allows a variety of non-Apple printers to be connected directly to the Macintosh and provides full text, graphic and paper handling capabilities. The new HP IIP printer understands only the HP PCL printer control language and consequently cannot be used in its basic form with the Macintosh. MacPrint translates Macintosh printer commands into

PacificPage offers PostScript language compatibility in a plug-in cartridge.

Business and technical professionals who want to print color graphics and text using a single device now can consider the new HP PaintJet XL color-graphics printer.

a format that can print on the LaserJet IIP, as well as a number of other PCL based print devices.

Laser Control 3.3 allows existing application software packages to use all the features of the LaserJet Series IIP regardless of compatibility between the application program and the printer. List price is \$149.

PrintAPlot provides the LaserJet Series IIP and any other PCL compatible printer with the capabilities of a pen plotter. PrintAPlot allows software applications using the Hewlett-Packard Graphics Language (HPGL) language to work directly with the LaserJet Series IIP. List price is \$199.

Circle 395 on reader card

PaintJet XL Offers Printer Sharing And Greater Speed

Hewlett-Packard announced the HP PaintJet XL color-graphics printer, which prints two to three times the speed of the original PaintJet and is intended for work groups that want to share a printer or for individuals who need a higher volume color printer.

The PaintJet XL offers increased speed, improved media handling, more media sizes, more fonts, better final copies and more pages per day.

A typical 8 1/2 x 11-inch (A size) page of graphics prints in 1 1/2 minutes. It also handles 11 x 17-inch (B size) paper. An automatic sheet feeder allows for unattended printing on up to 200 sheets of paper and 70 transparencies.

An optional cartridge provides 20 additional fonts and the printer will work with Type Director, a typeface scaling and font-management software program.

ASP's ServerJet Expands Capability Of LaserJet Printers

ASP Computer Products has announced an enhanced version of ServerJet that expands the capability of the Hewlett-Packard Series II and IID LaserJet printers by allowing more users instant and simultaneous access to the printer at a speed of 115,200 baud.

The ServerJet is a user installable board that plugs directly into the "Optional I/O" slot located on the back of the HP LaserJet printers. Because the ServerJet completely emulates the LaserJet's interface, all computers

that can print to the HP LaserJet, such as an IBM PC or compatible, Apple Macintosh, VAX or HP 3000, can now share the same LaserJet. Each user operates as if connected directly to the printer, and no user training is required. Price starts at \$495.

Solid Mac Interface And Spooler For HP LaserJet IIP

DataPak Software Inc., has announced full compatibility between its Printer Interface IV for the Macintosh and the new HP LaserJet IIP.

The interface is also compatible with DataPak's HP spooler allowing background printing.

Using DataPak's Printer Interface IV, Macintosh users can utilize this printer's text and graphics. Printer Interface IV, originally created for the original HP LaserJet series, provides a Chooser-selectable, Quickdraw at 75, 150, and 300 dots-per-inch, as well as full usage of the printer's built-in fonts and font cartridges.

Printer Interface IV lists for \$125 for the driver only, \$159 with spooler.

POSE Added To MDSS Application Software

With the addition of Picture Oriented Software Engineering (POSE), a CASE product, MDSS, the application software package for manufacturers, now gives users the ability to change software at the design level.

This collection of tools allows MDSS to draw data flow diagrams and action diagrams, decompose a data flow and to write software substantially faster.

Advantages to MDSS customers include

HP's User Interface Platform (UIP) is a software toolkit for creating graphic user interfaces.

the ability to discuss with MDSS staff the advantages and disadvantages of customizing MDSS, integrate the MDSS design into their software addition, and modify at the design level, rather than just at the code level.

Contact Manufacturing Decision Support Systems Inc., 300 E. Ohio Building, 1717 E. 9th St., Cleveland, OH 44114; (216) 861-8100.

Circle 394 on reader card

HP Software Toolkit Creates GUIs

Hewlett-Packard has introduced the User Interface Platform (UIP), a flexible software toolkit for creating graphic user interfaces.

UIP is an optional ex-tension to the Real-Time Applications Platform (RTAP). Together, they form an integrated set of software tools designed for engineers and programmers who build supervisory-control and data-acquisition (SCADA) systems.

UIP is based on HP's toolkit concept. It means that you can build solutions to many different classes of problems with the elements of the software. This makes the product well-suited to value-added businesses. They can customize software to meet a customer's needs and connect the software with other packages. Value-added businesses can use UIP to penetrate new industries and tie into other software technologies, such as artificial intelligence.

The principal feature of UIP is its ability to create smart symbols that can change appearance based on values in the RTAP

database. Symbols and schematics are drawn interactively using a mouse and palette of graphic building blocks and predefined symbols. UIP supports multiple windows allowing several monitoring screens of information to be displayed on one console.

UIP is based upon industry standards for use in a multivendor environment. These standards include the X Window System,

the HP-UX operating system and ISO networking.

CSI Unveils GrowthPower Inventory Counting System

Computer Solutions Inc. (CSI) has introduced the GrowthPower Inventory Counting System, a data collection product added to GrowthPower. Inventory Counting is designed for use with the HP 3000 line of computers and is a front-end module to the existing GrowthPower Data Collection product.

GrowthPower/Inventory Counting is priced at \$6,000.

Versatec Offers Electrostatic Plotting System

Versatec, a unit of the Xerox engineering systems division, has introduced a high-performance monochrome electrostatic plotting system — CADmate.

CADmate is designed to replace high-performance pen plotters for mechanical and architectural applications.

The Versatec CADmate provides near-laser quality, 300 points-per-inch (ppi) drawings, in 36-inch-wide format. It allows high resolution and definition without the higher data transfer rates required by 400 ppi resolution. CADmate accepts HP-GL data format and is plug-compatible with HP 7586 pen plotters. The acceptance of HP-GL data format allows existing CAD, mapping or graphics-based programs such as AutoCAD, VersaCAD, and MicroCADAM to be used without any changes.

CADmate includes a plotter, interface board, driver and software. The system is priced at \$13,900. Quantity discounts are available.

JobRescue saves your operations critical resources

JobRescue™ from NSD saves you two of the most important resources in business - *time and money*. But these are not the only critical things we save you.

For starters, this HP3000 software substantially improves operator productivity: 1) by automatically checking for errors as soon as a job logs off; 2) by allowing on-line access and reprints of \$Stdlists/Reports; and 3) by eliminating the need for manual logging and starting of jobs and manual distribution of reports.

JobRescue saves you considerable paper and printer costs too. And you can keep reports on-line based on time or number of generations. You can even specify exactly what will be printed out- partial reports, error \$Stdlists, whatever.

For you this means far better communications.

Using JobRescue, you're able to trap all errors and choose from a variety of convenient ways to alert support personnel. You can even run multi-threaded production jobs based on a calendar for days, months, or years at a time.

So if you want to dramatically improve your operations, call us about JobRescue today. And start saving immediately!

JobRescue saves
you time, money,
paper, and head-
aches - allowing
operations to run
smoother, faster,
and better than
ever before.

CIRCLE 152 ON READER CARD

**Crossing The Bridge
Between DOS And HP-UX**

GETTING STARTED WITH UNIX

[B Y A N D Y F E I B U S]

Most of us are blessed (or cursed) with a personal computer. You use your computer daily for word processing, spreadsheets, phone lists, calendars or (when no one is looking) games. You know what to do when the disc becomes full. You can start and terminate your favorite programs. You can list your files and reorganize their locations. You can get your printer to work most of the time and, when all else fails, you know where the on/off switch is located.

But now you're required to use the new HP-UX system just installed in your office. An additional terminal has been placed on your desk (or maybe your PC is expected to become a terminal for the HP-UX system) and now you're expected to use the new system. Your palms sweat as you contemplate trying to struggle with the new system. Show no fear and read on.

PCs are single-user systems and only one user is expected to access the PC at any time. HP-UX systems, however, are multi-user systems that can have many different users accessing the system at any time.

To differentiate users on HP-UX systems, each user is expected to log on to the system before beginning to use it. On your terminal is the prompt:

```
login:
```

Your system administrator created an account for you that provides you with your own area for files and security to prevent others from accessing these files. This account was given a name. Ask your system administrator for the name assigned to your account and enter this name at the **login:** prompt (press the **Return** key after you have typed the name). The computer then asks:

```
password:
```

Your administrator assigned a security password to your account to prevent other users from accessing your files. Find out what this password is and enter it at the **password:** prompt. Notice that the letters you type are not displayed. Press the **Return** key after you complete the password. If an error occurred while entering either your account name or your password, the

computer will indicate this by:

```
Login incorrect
login:
```

Enter the information again. Don't use backspaces when entering the account name or password. If you don't get it right after three tries, tell your system administrator he provided you with incorrect information.

Eventually, you'll get logged into your account. The computer provides you with some messages like:

```
Welcome to HP-UX v7.0 on pw-rda
```

The **\$** is a prompt similar to the DOS prompt **C>**. When this prompt is displayed, the computer is waiting for you to enter commands or execute programs.

Commands

SPECIFYING A COMMAND to run on an HP-UX system is the same as specifying a command to run on a DOS system. Enter the command name and any run-time arguments and then press the **Return** key.

However, the commands aren't the same. *Table 1* indicates most DOS commands and their equivalent HP-UX commands.

TABLE

Command	HP-UX Command	Command	HP-UX Command
APPEND	None (no such concept)	GRAPHICS	None (except under X Windows)
ATTRIB	ll (to view) chmod (to change)	JOIN	mount
BACKUP	tar, cpio, tcio, dd (depends on the backup media)	LABEL	None (no concept of disc drives)
BREAK	stty	MKDIR, MD	mkdir
CD	cd	MODE	stty
CHKDSK	fsck	MORE	more, page
CLS	None	PATH	set PATH=
COMMAND	sh, csh, rsh, ksh (start a new shell)	PRINT	lp
COMP	cmp, diff	PROMPT	set PS1= (sh, ksh, rsh) or set prompt= (csh)
COPY	cp	RECOVER	fsck
CTTY	< (Redirect each command using command < input)	REN, RENAME	mv
DATE	date	REPLACE	None (a shell program can be easily written)
DEL, ERASE	rm	RESTORE	tar, cpio, tcio, dd (depending on media)
DIR	ls, ll, l, lsf	RMDIR, RD	rm -r
DISKCOMP	None (no concept of disc drives)	SET	set
DISKCOPY	None (no concept of disc drives)	SHARE	None (file sharing is command-dependent)
EXE2BIN	None (no need)	SORT	sort
EXIT	exit, logout, CTRL-D	SUBST	None (no concept of disc drives)
FASTOPEN	None (no need)	TIME	date
FC	diff	TREE	ls -R, find . -type d -print
FIND	grep, egrep, fgrep	TYPE	cat
FORMAT	None (no concept of disc drives)	VER	uname
GRAFTABL	None (no need)	VERIFY	Option for tcio only
		XCOPY	cp -r

Table 1: DOS commands and the equivalent HP-UX commands.

HP-UX, a multitasking operating system, permits multiple programs to operate at the same time. These programs may be executed either in *foreground mode* or in *background mode*.

Three standard utilities come with all DOS systems. These utilities have equivalent HP-UX commands, as shown in Table 2.

As with many DOS commands, only certain HP-UX commands are useful. Many of the more useful HP-UX commands

are not shown in the above tables. Please refer to the HP-UX column in the February 1989 issue of *HP Professional* for the list of HP-UX commands that you'll use 90 percent of the time.

One major difference to note between HP-UX commands and DOS commands is that command options are specified differently. Most (unfortunately, not all) HP-UX command options are specified as **letter**; DOS command options are specified as **/letter**.

All HP-UX commands are described in the *HP-UX Reference Manual* (sections 1 and 1M). The descriptions also include the possible command options and arguments.

File Specification

WHEN SPECIFYING A FILE name to DOS commands, directory paths within the file are separated by a backslash (\). The HP-UX path separator is the slash (/). The directories . and .. have the same meanings for both operating systems. The ? and * wildcards have the same meanings, however, HP-UX will interpret characters properly following a * wildcard (DOS cannot).

On HP-UX file systems, a file suffix (and, therefore, the .

separator character) isn't enforced for any file. HP-UX files may contain as many as 14 (or 256 if extended file system names are used) characters; DOS restricts you to eight characters and a three-character suffix. Note: Although a file suffix isn't enforced for HP-UX files, certain HP-UX commands (e.g., any HP-UX compiler) require a file suffix to indicate the type of file.

Some examples of HP-UX file names:

```
/bin/ls
/usr/lib/lpsched
/etc/shutdown
```

These files illustrate the next concept that differentiates DOS from HP-UX: standard directory locations. DOS discs, because they're formatted by you and you load the software wherever you desire, don't have a structured file system. In other words, DOS discs are entirely unique from one PC to another (unless a

The main difference

HP-UX is memory.

standard is enforced by someone).

HP-UX systems, on the other hand, enforce a consistent directory structure across all systems for the operating system commands. The directory tree for this structure is similar to Figure 1.

Each standard directory contains a specific class of files and programs, as shown in Table 3.

Not all directories in the standard HP-UX installation are listed (too numerous to show here). However, as you can see, this structure is significantly different from DOS directory organization.

Table 3: Each standard directory contains a specific class of files and programs.

Figure 1: HP-UX systems enforce a consistent directory structure.

Executing Programs

UNLESS YOU'RE USING concurrent DOS or Microsoft Windows, you're only able to execute a single DOS program at any time on your PC. Some DOS programs are written to operate in a segment of memory and to be activated only when a *hot key* is pressed. However, most of DOS programs are written to be the only one running.

HP-UX, a multitasking operating system, permits multiple programs to operate at the same time. These programs may be executed either in *foreground mode* (the user must wait for completion of the command before executing the next command) or in *background mode* (the user may execute another command before the current command completes). You may start a program in background mode if the program doesn't require input from a terminal and output isn't expected to be written to the terminal; otherwise, start the program in foreground mode.

To start an HP-UX program in background mode, enter the program's name and arguments and terminate with an ampersand, as illustrated by the following command:

```
$ tar cf /dev/rct / &
```

Similar to DOS, HP-UX has the concept of a *virtual input device (stdin)* and a *virtual output device (stdout)*. When most pro-

R&D Muscle Power

As a power lifter in Unix™ systems research and development, you already know you don't need a lot of coaching – but when you do, you want the best you can get. . . and that's a call to Mt Xinu. The legendary power you get from MORE/bsd includes the ability to sit down with source or binary and an expert on the phone who can help you untangle the problem. MORE/bsd, quite simply, is the only fully supported, up-to-the minute version of

Berkeley 4.3BSD for Hewlett-Packard and VAX computers. Loaded with the latest: NFS 4.0, "Tahoe" networking improvements, diskless client support, even the best of System V . . . available in binary as well as source. At Mt Xinu, your coaches include folks here who were around when the first Unix system tape showed up at Berkeley over a decade ago. No wonder MORE/bsd is the system of choice for so many leaders in Unix R&D.

2560 Ninth Street, Berkeley, California 94710

415-644-0146

If you've been trying to struggle without it,
now's the time to power up with MORE/bsd.

In the research tradition: Unix system software for Hewlett-Packard and VAX computers.

MORE/bsd is available for Hewlett-Packard 9000 (Series 300 now, Series 800 in development) and most VAX computers. Registered trademarks mentioned and their respective holders include: Unix and System V, owned by AT&T; VAX, by Digital Equipment Corporation; NFS, by Sun Microsystems, Inc.; MORE/bsd, by Mt Xinu.

CIRCLE 131 ON READER CARD

grams are executed, these virtual devices are automatically associated with the user's keyboard and screen, respectively. Like DOS, these devices also may be *redirected* to other input and output devices by using the (redirect output) shell operators. Also, like DOS, the **stdout** for a program may be routed to the **stdin** of another program by using the pipe (**|**) operator.

The search path concept within HP-UX is also similar to the concept within DOS. To set the search path within HP-UX, however, involves using the **set** command to set the **PATH** environmental variable.

Program Memory

THE MAIN DIFFERENCE between executing a program under DOS and executing a program under HP-UX is memory. Under DOS, programs must execute within the 640 KB that may be addressed under DOS (unless the program is written to use *extended memory*. However, most DOS programs are written only to use extended memory as a last resort).

HP-UX, on the other hand, is a *virtual memory operating system*: All programs are provided with as much memory as

required *regardless of the amount of physical memory available in the system*. All memory is treated the same under HP-UX: No concept of "extended memory" vs. "normal memory" is needed. The amount of virtual memory available to a program is only limited by the size of the area of the disc reserved for the runtime copy of the program (the *swap area*). If a program exceeds the amount of virtual memory available, the program is aborted (as opposed to DOS, which usually will crash your PC).

HP-UX also attempts to insulate all programs from the operating system. When a program aborts because of an improper condition, other HP-UX users are rarely, if ever, affected. This insulation means that having to turn off an HP-UX system is a rare occurrence; many HP-UX systems are rarely turned off during the course of a normal year.

This information should provide a bridge for the DOS user to cross to become an HP-UX user. Once the user has gotten logged into an HP-UX account, many commands and operations are available. —*Andy Feibus is president of Processware Inc., Atlanta, GA.*

EXPRESSWAY RMX

EXPRESSWAY®

Get into the fast lane for less than a grand.

Now Eventide gives you a choice of Expressways. There's the industry's leading intelligent IEEE-488 Buffer/Spooler for HP desktop computers, our original Expressway. And now there's also the slim Expressway RMX, priced as low as \$995.

PROVEN PERFORMANCE

Eventide Expressways break the plotter/printer bottleneck that can tie up your HP desktop computer and slow productivity to a crawl. They've proven themselves again and again in daily use with thousands of HP desktop systems and instruments. And in Hewlett-Packard's own benchmark eval-

uations, Expressway boosted output command speed by 60 to 1400 percent. No wonder Expressway comes "highly recommended" by HP's Scientific Instrument Division.

A GENUINE EXPRESSWAY FOR JUST \$995

The new RMX model has all the functionality of the original Expressway. It comes standard with one IEEE-488 output and 256K of RAM. A RAM upgrade to 512K is available. (*The original Expressway can accommodate up to 2 Meg of RAM.*) To serve two plotters/printers simultaneously, you can also add a second output port board, which is available in IEEE-488, RS-232 or Parallel

versions. Of course you don't get the racing wheels pictured above, but removable mounting "ears" are provided with the RMX for convenient use with analyzers and other 19" rack-mounted scientific instruments.

FREE TRIAL OFFER

Want to see how much time you'll save with an Expressway? Call Eventide toll-free at 1-800-446-7878 for details of our free trial offer on either Expressway model.

Commercial UNIX

Acceptance Is Slow, But That May Change

HP Professional's editorial staff and guest experts recently gathered for an editorial roundtable on Commercial UNIX. The roundtable teleconference was moderated by Managing Editor Tom Halligan and West Coast Editor Peggy King.

Halligan: How do you foresee the commercial UNIX marketplace for application software? Will it be similar to the MS-DOS marketplace, where blockbuster products such as 1-2-3, dbase and WordPerfect dominate. Or, will there be niche products for specialized commercial applications, rather than one or two standards?

McCulley: Right now, I think what we're seeing in the commercial UNIX marketplace is the integration of the PC and minicomputer or the mainframe. With UNIX, that's really an area that no one to date has defined the PC integration strategy. Things like NewWave have the opportunity to offer a network or structure into which products like Lotus could fit and, therefore, users could be a lot more productive. I see us going in the middle of what you suggested.

There will be some niche products, but the overall framework, a Motif or one step further

in the NewWave environment, will really be what ties all these products together. And that, I think is going to be the glue in the commercial UNIX marketplace.

Marbach: From our perspective, Cynthia, the commercial marketplace has been very slow to

Professional
Press

accept UNIX. When I travel around looking for commercial UNIX sites I don't see a lot of them and I don't see a lot of generic commercial application software out there. Why is that?

McCulley: What we're hearing from a lot of the people is that UNIX does not fit into the DP centers or MIS centers at this point because it has not shown the same set of tools, and has certainly not been proven with the same performance that they've been able to get from proprietary operating systems.

People are starting to buy commercial applications using UNIX today in areas where it is sort of a standalone application. It may be networked into other areas, but only the small companies are actually putting their production systems on UNIX. The one exception is financial services. We have started to see activities going into UNIX in what we would consider production areas. For instance, the Singapore Stock Exchange is running on UNIX systems today. We sell quite a few HP systems there.

Stevens: It seems like there are probably three areas that UNIX needs to address before it will become fully functional for commercial applications. In the past, as an operating system, UNIX was not designed for transaction processing performance...that was not its intent. I don't personally see that as a barrier in the future. In fact, there are activities today by the database vendors in particular that are find-

ing ways to work around and through the UNIX operating systems to achieve fairly high transaction rates.

The second area is just the availability of application software. It takes a platform that seems to be viable before you start to see the application software move over...and I'm talking about the commercial application software. There's certainly a lot of application software addressing technical environments. I think you'll see that commercial application software will evolve and move over to our UNIX systems.

The final area is the range of tools that surround an EDP datacenter system. Those are the tuning, the monitoring, the batch scheduling, the spooler kinds of utilities. They are being provided in many cases by third-party suppliers, and you're seeing the system vendors themselves also start to offer those kinds of utilities. Those are three reasons that I typically hear from somebody showing hesitancy as to whether or not they want to just jump in with UNIX and do commercial processing.

Florio: I'd like to add just one other thing to that set of very accurate comments. The reason why there is a demand in the marketplace for UNIX, especially to move into the commercial environments, is that UNIX represents a concept of open systems that proprietary operating environments don't necessarily offer. The

"I think you'll see commercial software evolve and move over to our UNIX systems."

*David Stevens,
Hewlett-Packard*

push is coming from the experience of people in the IBM PC, MS-DOS environment, where they could get off-the-shelf software.

So, to a certain extent, you're seeing the UNIX market respond to the requests of customers that come from their experience with a quasi-open architecture kind of environment. The reason IBM PCs are an open architecture is that they're ubiquitous and they are exactly the same. The reason the MS-DOS is open architecture is that everyone runs effectively the same version of MS-DOS. Consequently, portable software products can be easily developed. The objective from the marketplace, the demand from the marketplace, is to provide a similar facility on UNIX for a new class of machines that is more than a single user, single passkey environment, but a much more complex, and comprehensive class of machines.

Feibus: What I'm hearing here is that, to make UNIX more commercial oriented, there are a lot of tools that are missing. But one of the things that's starting to appeal to people with UNIX is the fact that it is so standard. So who is going to develop these tools and get everybody to agree to use them?

Florio: There are tools available in the market to perform all those functions. The problem is getting this information out to the customer base. The major minicomputer-type suppliers of equipment like to sell their own products. They typically don't like to sell products that come through different channels of distribution.

Price: I do marketing consulting and part of my work involves talking to people who are really UNIX users. What I'm finding over and above everything else is that they love it. They think there are enough applications. They think there are enough system tools and they can't understand why people who aren't using it think that there aren't.

King: Nancy, are your customers in the multi-tasking environments and had they used system tools and found that UNIX provided what they needed?

Price: Yes, they had. One thing that I wanted to add is that the ones who like UNIX think that one of the reasons why others don't think that there are applications out there, or don't think that there are systems tools out there, is because they say the vendors aren't necessarily doing a good job of telling us about the solutions. They

bring up the case of IBM or companies that are selling in the IBM environment. And they'll say they are bringing us solutions; they are bringing us a way to handle our business.

Why aren't the UNIX vendors doing the same thing? There are all these catalogs out there and there are a lot of products in those catalogs and I don't know why they are not getting sold.

Feibus: Part of it could be advertising. The MS-DOS products that are out there are so inexpensive and yet they are advertised everywhere. You can pick up any magazine and find some MS-DOS tool being advertised. But UNIX, for some reason, as the price goes up the advertising goes down. You don't find tools on UNIX being advertised nearly as many places as the MS-DOS ones.

McCulley: We keep referring to the PC. I think there's going to be an environment where people want a small multiuser UNIX system. And they would be willing to look at a number of third parties and try to get tools and really package the system themselves for a small number of users. However, if you look at the datacenter, they don't want to have to buy tools from multiple people to put together a system that's going to run their business. If they are betting their business on it, they want to be able to go to an IBM of the UNIX world and buy a datacenter system that will provide the performance they require, the capacity they require and any growth that they will require in the future, and be guaranteed that their business isn't going to fall because of the choice they made. I think that's really the heart of the commercial UNIX question. Most of the people we're talking to are looking at UNIX in the datacenter — and that's where it has not gone, because the vendors have not pulled those tools together in a package in a system.

Florio: I would agree emphatically with just what Cynthia said. It is exactly right.

Halligan: How robust is HP-UX in today's marketplace compared to the other versions of UNIX operating systems?

Stevens: It goes back to the three areas that I identified earlier. I wouldn't pretend that HP-UX is all the way there in all of those areas. I think we are making a lot of progress in those areas. In our current release (version 7.0), we're seeing some very good numbers for transaction processing rates. While I don't

We're the Windows specialists.

Session for Windows: The next generation in HP terminal emulation is here.

Four years ago, Tymlabs pioneered the development of Session™ for Macintosh, an HP terminal emulator for the see-and-point desktop environment. Packing a sophisticated feature set into an intuitive, enjoyable and productive user interface, our Mac products have won acclaim from users and critics alike.

Building on the foundation of Microsoft® Windows for the PC, Vectra, and compatibles, we have been able to bring the power and ingenuity of our Mac-based emulators to Windows users as well. On both Mac and PC platforms, Session makes terminal emulation a full partner with today's desktop applications. For example, you can extract data from a database on your HP host and display it on your "terminal screen" (your Session window). Using the mouse or keyboard commands, you can copy the information into your PC or Mac-based spreadsheet, perform a few calculations, then paste

the results into a memo which you send out via HPDESK. You can even run multiple concurrent sessions on the host, leaving HPDESK or a lengthy compile running in one window, while you go on to other HP-based activities in another.

If this sounds like the solution you've been waiting for, don't wait any longer. Whether your organization has PCs, Macs, or both, you can standardize on Session for all your emulation needs. And because Windows is the stepping stone to HP NewWave and OS/2 Presentation Manager, Session protects your investment in software and training as you move to these powerful new environments.

"One of the things that's starting to appeal to people with UNIX is the fact that it is so standard."

*Andy Feibus,
Processware Inc.*

think we would claim that we're to the end of what we want to accomplish, in terms of commercializing HP-UX for commercial environment, we've made a lot of progress.

There are many applications yet to be moved into the environment to make it a more viable solution and there is certainly fine-tuning to take place as a part of the kernel of HP-UX. And, there are tools and utilities that HP, as a vendor, wants to supply around that operating system. But I don't think there are reasons today to avoid HP-UX commercial environment for any real shortcomings.

King: If the OSF version of the UNIX operating system becomes the industry standard, do you think it will be essential for vendors to drop their proprietary systems and only promote the OSF version?

Feibus: It won't happen. And not to sound terribly pessimistic about the whole thing, but even in the OSF standard there are still POSIX and X Open and all the other standards that are emerging around UNIX. There are still a lot of areas for extensions and improvements and ways

to make things easier. I just don't see vendors with an installed base doing anything other than supplementing their versions with the OSF standards. I just can't see it happening. They have too much of a vested interest in making sure all their customers are compatible.

Marbach: Do you see a situation where a customer of HP-UX will think of it as a superset of the OSF version, is that reasonable?

Feibus: Yes.

Marbach: OK, so if we consider that UX is going to be a superset of OSF, then a customer spends four or five years intertwining himself around UX, has he lost his ability...some of the freedom he had because he went to the UNIX standard to begin with? Isn't he as much tied to a proprietary UX as he was tied to any other proprietary operating system?

Feibus: If he's not careful, it just makes the port harder. It doesn't restrict you because given enough time and money you can take any application and move it to another platform.

Florio: You know, in the old days in mainframeworld we had the same argument about

On January 10th, we had the first party.

COBOL programs. It was virtually impossible to implement a COBOL application on a Sperry, Burroughs or IBM mainframe without implementing some of the features proprietary to that specific operating environment. Yet, COBOL remained probably one of the more portable environments and was chosen by MIS directors because of the portability. Portability is not a binary issue, it is a scalar issue. Some things are more portable than others.

I have a phrase for this whole OSF/UNIX international war. My open system is better than your open system and I have the proprietary features to prove it.

Feibus: That's it.

Florio: And everybody's shooting themselves in the foot, I think, around that particular issue. But the issue is if you write an application in the style of UNIX, as opposed to the style of another modern operating system, it will tend to be more portable than an application written, for example, on a modern proprietary operating environment to another modern proprietary operating environment. Does that

make sense?

Feibus: Yes.

Marbach: It does, but do you think it would be possible then for vendors to produce a product that takes advantage of those enhancements to the standard and yet be able to go across many different operating platforms?

Florio: I'm going to make a projection now... I think the situation is going to boil out a slightly different way. Twenty years ago we sold hardware and gave away software. If the operating system becomes the same for everyone, we're effectively back into that same domain. You see, if the underlying operating system becomes exactly the same for everyone, then we're giving away operating system software, and operating systems cease to be a differential advantage in the sales environment. Then your features become a differential advantage in the sales environment. Customers don't buy machines with operating systems. Customers buy solutions.

Feibus: Yes, but that again assumes that you can get IBM and DEC and everyone else to agree

"Customers don't buy machines with operating systems. Customers buy solutions."

*Michael Florio,
UNIX usr/group*

digitalTM

DECstation 3100 workstation

It was a day for celebrating.

Because that was the day we broke with the news of our DECstationTM 3100 workstation, the first of Digital's family of UNIX[®]-based RISC workstations, systems and servers.

Shortly thereafter, we added to the family with the announcement of our DECsystemTM 3100 multi-user computer.

January 10th was also a day we broke something else—the \$1,000 per MIPS price/performance barrier. Something no one else had ever done.

The cheering you probably heard came from users whose applications always have them looking for more power at their desks. At last, a full 14 integer MIPS UNIX-based workstation was available at a price they could afford.

But the reasons for celebrating didn't stop there. While its unmatched price/performance put it in a class by

itself, the DECstation 3100 workstation fit perfectly into our integrated approach to computing. It includes the ability to share with VAX/VMSTM systems, Apple[®] Macintosh, MS-DOS[®] PCs and, of course, other UNIX systems.

No wonder January 10th was a day everyone celebrated.

"A lot of vendors are talking about how they would love to sell commercial UNIX into the Fortune 1000, into the mainframe sites."

*Nancy Price,
Price Associates*

that there will be one operating system and everybody's version is going to look the same.

Florio: To the extent that we got everybody to agree that there was one COBOL and everybody's COBOL was going to look the same.

Feibus: Yes. There are always going to be extensions to the standard and the hardest thing is writing your code and knowing ahead of time whether your violating the standard. And if you don't violate the standard, then you have a good chance of being able to port your product in a very quick time.

King: Now that OSF/Motif is out in prototype, do you think that this will really get the ball rolling with commercial applications systems developers, once they have the feeling that there is a stable graphical user interface standard?

McCulley: I think that I have seen X window activity on the technical side evolve as the client-server distributed computing model has evolved. I have not seen that become as prevalent on the commercial side at this point. Again, the one exception will be financial serv-

ices, the broker's workstation that has made a move into high-performance graphics workstations with servers and extensive use of X Windows to reduce the workload or the clutter on a broker's desk. I see the commercial marketplace moving towards that but perhaps slower than we might want.

Halligan: Nancy, in what market do you see the short-term and long-term growth of the commercial UNIX applications?

Price: Actually, I see most of the growth, especially the short term and moving into the long term, in more of what we were talking about earlier, the mini side of things. I think that a lot of vendors are talking about how they would love to sell commercial UNIX into the Fortune 1000, into the mainframe sites. People don't want to change their mainframe applications. They are into CICS, IMS, and now they're getting into DB2. They don't want to change the way they are running their businesses. But many of them are willing to talk about some of their new applications, their smaller applications moving onto a different

On July 11th, we
had the second party.

environment. They're very excited about that.

McCulley: I'd also add that they are offloading some of their mainframe applications; they don't want to buy another mainframe but this is not critical to running the business. They are also using it to tie in their user interface machines, whether they are terminals, a PC network or a workstation, or a graphics workstation where they could have a user interface, if you will, in the future. If we are looking toward the future and running a number of applications with the minicomputer as the server environment, therefore you have a central application with access to it from the user interface or from the user terminal or machine.

Price: But I think that everybody's doing that and moving slowly toward it.

McCulley: The people who are doing that more are the ones with branch offices who need to put some sort of application ability and computing ability down in the branch office. And rather than hook them back to the mainframe they might break off part of the mainframe into a minicomputer running UNIX and hook into

the branch office via that minicomputer.

Mallery: Do you know what would sell an awful lot of UNIX at Professional Press? The advent of Aldus Pagemaker ported to workstations.

McCulley: Text processing — actually that's an area where UNIX has grown quite quickly and we have very good text processing tools. Desktop publishing has been very strong and it has sort of been an outgrowth of some of the engineering workstations application.

King: Mike, because you are a UNIX software vendor, do you find that your customers come to you for a UNIX solution or do you have to sell them on the advantages of the platform? Do they have to buy the hardware first or how does it work?

Florio: My customers are major OEMs both domestically and internationally and we bend a subsystem that supports document images in an X or ANSI terminal environment. Those customers don't ask about it, they demand it. They want TCP/IP, TCP/UDP support for image manipulation, image movement around a net-

"Once somebody gets a chance to use UNIX and sees the flexibility and the power of UNIX, you end up converting a lot of people."

*Cynthia McCulley,

digital™

DECstation 2100 workstation

Almost 6 months to the day, there was another reason to celebrate.

Because that was when we announced the DECstation™ 2100 workstation, the latest member of Digital's family of UNIX-based RISC workstations, systems and servers. In fact, on July 11th, the breadth of our offerings

extended from the DECstation 2100 all the way up to the DECsystem™ 5800 multi-user system — the industry's broadest range of compatible UNIX-based computers.

In the family tradition, the DECstation 2100 workstation broke new price/performance ground, too. It gave users the most powerful entry-level UNIX-based workstation available in the industry — 10 integer MIPS for under \$8,000. The power of a RISC workstation for the price of a PC.

Besides sharing price/performance leadership, our two UNIX-based workstations shared a lot more. For example, the way they adhered to industry standards like the X Window System,™ OSF/Motif, TCP/IP, NFS,™ IEEE POSIX 1003.1, X/Open XPGII, among others.

The DECstation 3100 workstation on January 10th.

The DECstation 2100 workstation on July 11th.

Party. Party.

"Are you getting many converts from MPE? Are you convincing any of them that UX is the way to go?"

*Carl B. Marbach,
Professional Press*

work. We don't have any choice. If you were to go down the list of the 15 top computer companies in the world, most of them would be the guys that we are talking to and they demand UNIX.

Marbach: Why?

Florio: Because they intend UNIX to be the platform. The document image processing marketplace, which is the superset, in fact, of the document creation marketplace it's this notion of handling document images as a data type. It's kind of like Wang/Wyse. Wang/Wyse is a closed document image processing system. In that marketplace every major vendor has chosen UNIX to be the platform for that application. It requires a client-server model, it requires a powerful host to house databases and it requires very powerful workstations to handle the document images because they're a very large data type and they just demand UNIX.

Halligan: What are some of the obstacles in the acceptance of commercial UNIX within the HP community today?

McCulley: Well, I think some of the things

Dave (Stevens) mentioned up front. People have the perception that MPE is a closed operating system and you open it up where you want it and UNIX is an open operating system and you close it off where you want to restrict access, and that makes a lot of people nervous. UNIX has come up very quickly. It's been considered an engineering operating system written for engineers by engineers. And, therefore, people seem concerned about how friendly it is. Certainly people who are used to RTE and the HP environment see UNIX as more friendly than RTE, but certainly not where you need to be, compared to MS-DOS. So there has been some reluctance. But I find, as Nancy mentioned, once somebody gets a chance to use UNIX and sees the flexibility and the power of UNIX, you end up converting a lot of people towards UNIX. I think they fall short of running their business on it, unless they are a very small company and they have one computer that does it all. But, I think a lot of it is just the hype in the marketplace has left a lot of people thinking "I need to look at UNIX...but

Now look at the third parties.

While all this celebrating was going on, it's clear that some people have been hard at work.

The software developers.

In an amazingly short time, they've already developed an impressive list of applications that run on all our UNIX-based RISC workstations and systems. And the list is rapidly growing. For the complete list of

applications, as well as performance data, call 1-800-842-5273, ext. 300.

what is it really going to give me?" It sounds like a panacea, but I know there's no such thing.

Marbach: Are you getting many converts from MPE? I could understand somebody who doesn't have a lot of experience with a real mature multiuser operating system looking at UNIX and saying it's terrific, it's wonderful, but how about the loyal installed base that HP has of MPE users? Are you convincing any of them that UNIX is the way to go?

McCulley: I think the people who are looking at UNIX as an alternative are the VARs who see the movement towards UNIX and see it as an alternative operating system and a new opportunity for people who buy UNIX solutions. I think the major accounts are looking at UNIX for particular applications to tie in their engineering efforts and their manufacturing efforts. But no, we don't have companies who are throwing out MPE and saying that they want UNIX instead — nor do we want them to.

Price: I really think that a lot of it has to do with people's perception of what is out there.

There really are things out there — application products, systems products, good databases, good hardware...fantastic hardware. But people have this perception that it is very very difficult to use. I think one way that that perception could change, and I think that is starting to happen now, is that the press is getting more and more interested in user stories. That helps people who are potentially users or who are beginning to say "Hey, so and so is doing this, I can do it too." And I think we need to have more and more of that.

Editors Note: HP Professional will be publishing users experiences with their UNIX operating system throughout the year. HP-UX 7.0 Unites Technical Families

New Release Links Series 300 And 800 Systems

Last month, Hewlett-Packard began shipping HP-UX 7.0, a new version of its implementation of the UNIX operating system. With its new release, HP now has linked the company's two families of technical computers.

According to Dave Stevens, software planning manager for HP's General Systems Division (Cupertino, CA), a major goal of HP-UX 7.0 was to converge operating systems for HP's Motorola 68000-based Series 300 workstations and HP's RISC-based Series 800 systems.

"If you're a Series 800 user, you may find it odd that your last release was 3.1 and you're jumping to 7.0," Stevens said, "We've converged the numbering of the Series 300 (operating system), whose last release was 6.5. The new version marks the first operating system upgrade since the spring."

While the two product lines are not object code compatible, they're essentially source code compatible. Because of the underlying architecture, there is not a binary standard. According to Stevens, Version 7.0 reflects a major effort toward converging source compati-

bility for the different architectures. The remaining differences are essentially tied to configuration of the system — architecture-dependent issues.

"Consequently, users who write applications for one product line should be able to port them to the other fairly easily," Stevens said, adding, "As long as you're writing in various ANSI-standard languages and making standard system calls and commands, you should see compatibility across those two architectures."

System administrators also will find that managing products from the two families will be easier. According to Stevens, the System Administration Manager (SAM) packages that come with HP-UX have previously been available only on the Series 800. Now, they are available on the Series 300.

Similarly, this is the first release to provide Series 800 discless node support. For example, users can run a Series 800 as a server with either Series 300s or a Model 815 as a discless client. Previously, users were required to use a Series 300 as a server for discless Series 300 workstations. "This brings 'mixed clusters' or the ability to mix Series 800s and Series 300s in a discless environment," Stevens added.

[BY SHARON FISHER]

The value of your data is only as good as your access to it.

In a way, it's ironic. We invest millions of dollars to develop computerized systems to store information... data that is crucial to managing a successful business. Yet the sheer volume and variety of data that we have to store make it increasingly difficult to find the specific information we need to make decisions.

Executive Information Systems (EIS) are the latest approach intended to address the problem. In theory, an EIS should provide "easy access to individually specified mainframe information by non-technical end users."¹ In reality, it can't be done on the HP3000 without OMNIDEX.

OMNIDEX gives users the ability to instantly retrieve records based on multiple field and multiple set selection criteria, keywords and partial key values. Users can access information through all major report writers and with programs written in any 3rd or 4th GL, or use their PCs to retrieve summarized HP data directly into a Lotus 1-2-3™ spreadsheet using OMNIVIEW.

Reports that used to take hours to complete can be done in minutes. Critical information can be retrieved on-line in seconds. Never again will your users have to say, "I know that information is in here somewhere..."

Moreover, applications written for previous versions of the operating system will continue to run on the new version.

IN ADDITION TO PROVIDING compatibility with other HP-UX products, HP-UX Version 7.0 is compatible with other UNIX implementations as well. HP-UX always has provided a combination of AT&T System V UNIX and selected features from Berkeley UNIX. "There are pieces of Berkeley, but not the entire system," Stevens pointed out. Version 7.0, for example, is based on UNIX System V.3 (though not the recently announced V.4) and passes AT&T's System V Interface Definition (SVID) 2.

HP-UX also includes Berkeley features, such as the fast file system, long file names and the C shell. "There's a high correlation between HP-UX and the Berkeley systems, but it's not 100 percent ... with System V, there is a test suite you can comply with, and we do that," Stevens said.

For that reason, applications that are written for the System V.3 operating system should be a very straightforward port to HP-UX.

HP also has added features that are intended to fulfill the Department of Defense's (DoD) C2 Trusted System Requirements. The features, which make the system more secure,

have not been evaluated yet by the DoD, and such evaluation takes some time. However, HP is considering doing a joint evaluation when it moves to the next level of security," according to Stevens. "It's likely to be a year before it's evaluated," he added

More HP-UX Features

VERSION 7.0 OFFERS A number of other new HP-UX features, including support for Sun Microsystems Inc.'s Network File System (NFS) 3.2. This new version of NFS offers the capability of remote locking with greater granularity on file systems that aren't local. This means users can lock smaller portions of a file. Depending on the system users choose, NFS may be bundled or may be a separate purchasable product. A future version of HP-UX will support the Government Open Systems Interconnection Profile (GOSIP) of communications protocols, according to Stevens.

For Series 800 machines, Version 7.0 offers support for disc mirroring with HP Fiber Link (FL) disc drives. Disc mirroring means that the system has two hard discs and data is written to both in case one disc fails. DataPair/800 gives users

Eliminate Data Bottlenecks with Intelligent Interfaces

HP-IB Buffers

MicroPlot 80 Series

free HP CAD/CAM/CAE work stations from time-consuming data output. Gain at least 5:1 improvement in computer utilization.

- Expandable 256K - 8 megabyte memory
- Multiple copy & plot queuing eliminate delays
- Full status monitoring
- Prices start at \$995

MicroPlot 70 Series

Ideal for large printing or small plotting applications.

- Expandable 256K - 1 megabyte memory
- Plot queuing, pause, copy and purge functions
- Prices start at \$845

RS-232 Buffers

MicroPlot 55 Series

free 286/386 PC workstations. Realize all the computer utilization efficiencies during printer/plotter operations as the MicroPlot 80/70 Series. Same features plus:

- Automatic learn mode for end-of-plot sequences
- Supports all popular hardware/software protocols including "HP-Mode"
- Baud rates > 100K baud
- Prices start at \$895

HP 200/300 Memory Expansion Board

MicroRAM - \$775

1 megabyte memory expansion board for HP Series 200/300 computers.

- Easy snap-in installation
- Fully compatible with HP boards
- Switch selectable addressing

GPIB-1000 - \$219

IEEE-488 interface card for PCs and compatibles.

HP-IB ↔ Centronics Converters

MicroPrint 45 Series

Has become the industry standard to reliably interface Centronics printers with HP computers (45C), or HP-IB peripherals to PCs (45H).

- No programming needed
- Transparent to operating system
- Switch selectable HP-IB address/Listen Always
- Prices start at \$209

call 800-842-0888

High-power HP and PC users shouldn't have to wait for output or be restricted in choice of peripherals. Allow us to be your single source for cost-effective interfaces. With each product comes a one-year parts and labor warranty AND 30-day money-back guarantee. 24-hour service is standard.

I INTELLIGENT INTERFACES Inc.

two-way disc mirroring with the ability to do online backups using one of the disc banks for backing up the system while it's in operation. This separately purchasable feature is transparent, so no changes need to be made to applications to take advantage of it.

Version 7.0 includes several ease-of-use features. For example, a network update capability allows system administrators to update their systems to HP-UX 7.0 remotely. In addition, the ELM screen-oriented mail system will now be provided as a standard feature.

Features that have been supported in earlier versions of HP-UX continue to be supported, such as native language support (including support for National Language Input/Output (NLIO) which allows HP-UX to support Asian languages), DOS emulation through a product called SoftPC, and automatic restart battery backup capabilities.

Various communications products continue to be available as separate products, such as support for Transmission Control Protocol/Internet Protocol (TCP/IP), Berkeley Advanced Research Project Agency (ARPA) services, and HP Networking Services (NS), which allows HP-UX systems to communicate with HP 3000 minicomputers.

The minimum memory and disc requirements for Series 800

machines are 8 to 12 MB of memory and 150 MB to 18 GB of disc. For Series 300, the requirements are 4 to 48 MB of memory and 80 MB to 4 GB of disc.

Existing HP-UX users who are on HP's support service will receive HP-UX 7.0 free as part of their support update. If the users don't have support but want to update their systems, the upgrade can be purchased from HP for a price slightly higher than the price of an annual support contract.

The cost and number of users supported depends on the system. "When you buy a Series 800 family system, you get a 16-user license," Stevens explained. "On the Series 300, you get a 2-user license on workstations, and can upgrade." In addition, on the Series 300, HP-UX is available as an 'execute' only" license that does not include the full programming environment.

And, there's more to come in the next few months. HP plans to integrate HP-UX with the Domain operating system of its Apollo workstations, as well as with Open Systems Foundation (OSF) UNIX.

FULL SCREEN TEXT EDITING

SpeedEdit is an all new, state of the art, full screen text editing system designed for the professional programmer. The **SpeedEdit** system is the first programmers editor for MS-Windows® and Presentation Manager® as well as being the first text editor with Remote Program Development (RPD) capability. **SpeedEdit** is the first in many other areas as well, and of course **SpeedEdit** has powerful features like multiple

windows, keyboard macros, compilation, regular expressions, and all of the normal editing functions as well.

SpeedEdit is acclaimed as the most capable, yet easiest to use, text editing system available today. In addition to all this, **SpeedEdit** is available on a wide variety of operating systems and platforms, making **SpeedEdit** the only editor you need to know.

Versions of **SpeedEdit** are available for Windows, PM, non-windowed DOS or OS/2, and HP-UX® on the HP-9000 as well as MPE and MPE-XL on the HP-3000. Give us a call for more information on this exciting family of products.

THE USER'S PERSPECTIVE

Writing A Program? Make Sure You Consider The User's Point Of View

SOFTWARE DEVELOPMENT

Lisa Burns

A few years ago, I wrote a data entry program for Stanford University using Lotus 1-2-3 and the HP PortablePlus laptop computer. It was a great learning experience for both parties. I learned Lotus and macros, while the Stanford fundraising office learned to use PCs for pledge tracking.

However, a very interesting thing happened to me while pilot testing the program: I had to use it! What a shock it was to realize that my masterpiece was a tremendous pain to use.

The program was easy to write and change, but awkward and clumsy for data entry. A lot of tabbing was required, mistakes were easy to make, and data entry took a long time. Training the Stanford staff was more difficult than I had expected and many of them were reluctant to use the package until it was improved.

I had made the mistake of writing the data entry package from a *programmer's* perspective, not from a *user's* perspective.

As a programming/system analysis manager for Hewlett-Packard, our project teams take a different approach than I took with Stanford. We work closely with users and with user representatives throughout our development process to ensure that the user interface on our business applications fits efficiently into the data entry process. Also, we make sure that user needs for efficiency, keystroke reduction and productivity are met.

In order to help you work better with users in your own shop, I'll describe the process we use to maintain a user perspective throughout the entire software development lifecycle.

Also, I'll discuss the results we have had with user involvement in HP's sales systems area.

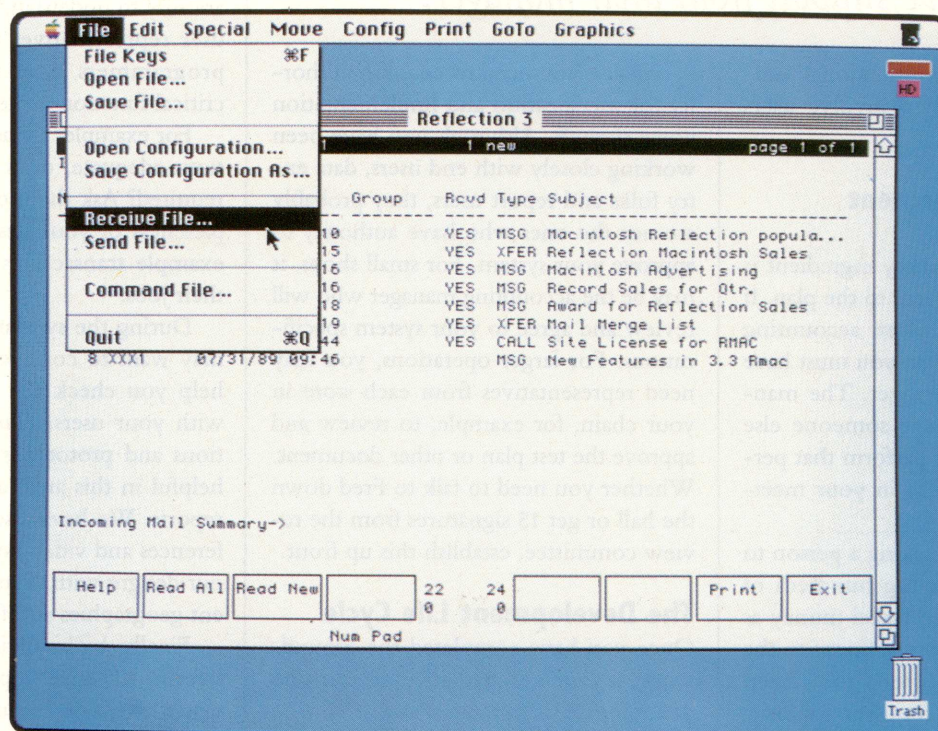

Who Are Your Users?

The first thing we consider when setting up a project in our shop is, "Who are our users?" This may seem like a simple question, but sometimes the answer is far from clear. For your own shop, you first need to consider your primary users. These are the people who use your system directly, work with your data entry screens, your reports, your online inquiry and other system functions. Next, you need to look at those departments and people who use your data, who need summary information, or who read your database directly. These people must also be involved in your design activities.

For example, a work order processing system may have work order data entry people and maintenance staff as primary users. These people enter and retrieve data directly from screens and reports. However, accounting workers who book maintenance billings against the general ledger are indirect users of work order data and should be represented in a system design.

Once you have identified your user base, you need to plan the involvement of representatives of that base in your development process. If you sit next to your users, as many MIS folks are lucky enough to do, you may simply need to plan weekly meetings with them to clarify needs and review specifications. If your users are scattered across several cities or countries, as ours are, this may not be practical. Instead of weekly meetings, you may need to set up telephone conferences, video conferences or perhaps monthly meetings to discuss system plans. Be sure that your plan includes a cross

How to access an HP host in two easy steps:

1. Point. 2. Click.

Combine the very best parts of an HP terminal and the Apple® Macintosh, and you get **Reflection® for the Macintosh.**

Reflection for the Macintosh turns your Mac into a full-featured HP terminal driven by the friendly Macintosh® interface. It's powered by the same quality features you're already familiar with in PC versions of Reflection. Now we've added context-sensitive help and a com-

plete Macintosh backup capability.

Whether you need graphics terminal emulation or just alphanumeric emulation, Reflection for the Macintosh provides an easy path to host data.

CIRCLE 146 ON READER CARD

section of your user base.

For example, this may mean getting both data entry people and management report users involved in your meetings, or involving one sales representative from

portant, because they have lived the life of a system user, they will have a completely different perspective than that of your programmers. This perspective is critical to your success.

A key ingredient is management commitment to the plan. If you need two hours of an accounting clerk's time once a week, you must have support from their manager.

each district. For a multinational situation, you may need to involve users from several countries.

Encourage Management Commitment

Whatever your plan, a key ingredient is management commitment to the plan. If you need two hours of an accounting clerk's time once a week, you must have support from their manager. The manager must agree to have someone else answer the phone and perform that person's tasks while they're in your meeting.

Similarly, if you're asking a person to attend a monthly meeting hundreds of miles away, you'll need travel money as well as management commitment to the time away from the user's job. Even a phone conference requires support. Establish the time and financial commitment with user management before you go any further with your project.

Another option to consider when setting up user involvement is to avoid the necessity of borrowing time from a user by hiring them instead. By including former users on the project team itself, you have dedicated resources at your disposal. You need not wait for a meeting or conference to clarify a point or check a specification. Also, these user advocates likely will have many contacts from their old job. They can then research problems and clarify questions quickly. Most im-

Finally, you need to establish authority for specification and implementation phase signoffs. Although you have been working closely with end users, data entry folks and report users, they probably are not the ones who have authority to approve your system. For small shops, it may be the accounting manager who will review and agree to your system specifications. For larger operations, you may need representatives from each store in your chain, for example, to review and approve the test plan or other document. Whether you need to talk to Fred down the hall or get 15 signatures from the review committee, establish this up front.

The Development Life Cycle

Once you have completed the groundwork, it's time to start investigating and designing.

Our life cycle, which is probably similar to your own, goes from investigation to external specifications, to internal specifications, followed by coding and testing, and finally user alpha site testing. During your investigation, you want to fully understand and document existing information flows and system designs. In addition, you want to ask about functions missing from current systems and procedures. This will probably mean that programmers need to watch users performing their jobs even if you have users on the project team itself. Additionally, you may interview the users you have hired or arranged time with and have them explain their business process to you.

Once you have completed the inves-

tigation and generated whichever documents or flowcharts are needed, design work begins. This is where user involvement is, by far, the most critical. As you prepare draft screen and report layouts and as you begin describing the functionality of your system, work closely with the users you identified earlier. Ask them to check the placement of fields on screens and make sure that you do not require the user to tab all over the place to get to a frequently used field. Be sure that reports are organized intuitively and are easy to understand. Above all, ask the user representatives to make sure that programmers have not overlooked a critical function or field.

For example, are add and delete functions adequate, or is a modify function required? Ask the users to test the completeness of your designs by looking at example transactions or inquiries from their jobs.

During the system design phase, you may want to consider different tools to help you check the proposed software with your users. Hands-on demonstrations and prototypes may be especially helpful in this area, as may mockups of reports. We have also used phone conferences and video conferences to check our designs with users from many different geographies and functions.

Finally, by involving user representatives in software inspections (also called structured walk-throughs or peer review meetings), you can uncover and prevent system design defects and ensure that all designs are adequately reviewed.

At the end of this design phase, you will probably produce an external specifications document, or at the very least, a set of screens, edits and reports. When this is published to your users, you undoubtedly will be asked to change it — in fact, if you are not asked to change it, the users may not have read it!

Because of the upfront work you have done reviewing and prototyping your system with various user representatives, hopefully you'll have a proposed system very close to user needs, and the changes

requested will be minor and easy to incorporate. Assuming this is the case, you must now make the appropriate changes and announce that additional changes will become more expensive as time goes on.

The phrase, "speak now or forever hold your peace" is appropriate here. While completely frozen specifications are impossible, you should aim for something pretty "slushy" before you get user signoff on the external specification (ES).

Getting Down To Business

Now it's time to write the internal specifications for your system. This is mainly a technical activity, so user involvement will be less at this stage. You may be able to give your users a break, or if you have hired user representatives, you can start them writing the documentation for the system. Programmers may still occasionally need to contact them for clarification on edits or system functionality, however.

Once you have completed pseudo-code, modules narratives or hierarchy charts for your system, and you begin coding and testing, user involvement will increase again. You'll need to include users in test plan writing and execution. This is another critical task. If you're like me, you're not very good at thinking up realistic test cases. For example, the only HP product number I know off the top of my head is the 2225A, the Thinkjet. Sales orders with 20 line items, all 2225As, don't make very representative test cases.

For this reason, taking sample transactions from your users' production workload is a great idea. User representatives can help you test error conditions, boundary conditions, as well as realistic production transactions. You will probably want to include them in software inspections of your test plans, and you may want to have them actually execute the unit tests themselves.

One caution here: Don't leave your programmers completely out of the unit test execution. Having to actually use your own software can have a very sobering effect. By testing your own code, you can begin to see why having to tab

over 15 fields to get to the one you need is an annoyance. Programmers working with users is probably the best combination for testing.

As you approach the end of the construction phase and are executing the final unit test plans and fixing minor defects, you want to involve the users in writing your system test plan. Again, they will help ensure that you are covering all

production cases as well as error conditions. In addition, they will help you make sure that your test environment matches a true user environment.

For example, they can help you in storing copies of user data files, databases, account structure and user lists, and restoring them onto your test machine or into your test account. This will make sure that your test environment is as close

What is Systems Integration?

From design to construction...

IISI knows the answer.

Integrating:

- information flow
- business demands
- software applications
- hardware platforms

Systems design and Systems integration

IISI builds integrated systems from blueprint designs through final construction.

Working closely with management and end-users, IISI designs and builds a solid systems foundation and provides the resources to construct the entire system.

IISI is not a contract programming house. All IISI employees are full-time, trained systems consultants who specialize in Hewlett Packard commercial applications.

IISI delivers systems integration services worldwide and can help you build the systems your business needs.

63 Nahatan Street, Norwood, MA 02062

Boston, Philadelphia, Washington D.C.

For free project management worksheet, return reader service card.

as possible to the one you will encounter in production. Also, users can help you exercise the system's complete functionality — all kinds of transactions, data flows and interfaces. You certainly want to have them review your system test plan document, and you may have them run the test itself.

One important thing to keep in mind during the system test is that you may need to involve programmers and users from other functional areas during the test. For example, if you are testing a new invoicing system that updates the accounts receivable files, you may need to involve users from the accounts receivable (AR) department as well as the invoicing area. Be sure to plan with the AR department well in advance to arrange for these people to help you. State clearly the time and task requirements so that there are no surprises later.

As the system test winds down, you should be meeting with the users who actually will run the production test of the new software. Testing a new system requires time away from their jobs and will mean extra effort for both the users and the development team. Be sure that you cover how each feature will be tested, whether parallel procedures are involved for an initial time, and how to move from parallel to production. Also, remember that they need not only to test the software itself, but also the training and documentation for the system. They also will test your software installation as well as the installation procedures. The end users probably have better ideas than you do about how to test the system's functionality — let them decide what will work best.

Next, decide how changes will be made to the new software during the production test. You may need to establish criteria for critical needs vs. enhancements. You also will need to decide how and when to install any changes to the software. For example, will the development team simply move the new code onto the production machine or account? Will tapes be given to the sys-

Programmers unfortunately think like programmers; you see your software through the eyes of someone who works with your data entry screens 40 hours a week.

tem manager? Will PC users be given new floppies? How will versions be tracked? These things sound simple, but if they aren't planned, many bad feelings may result.

Finally, decide how to get signoff on the new system. Will you need to bring in all 15 user council members for a review meeting, or will buying Fred a beer be enough? How will any open issues be resolved? By establishing these procedures before the start of the production test, you will avoid many misunderstandings.

In our shop, we have found that the steps listed above work very well. There seems to be a very direct correlation between user involvement and the subsequent success of the project.

Several of our project teams have received commitments from user management to have users spend time reviewing documents or helping the development team by answering questions.

One of these project teams has taken the approach of setting up a user council. Representatives from each of the several user sites meet once a month or so throughout the life of the project to review documents from the development team. At these meetings, they also may view prototypes, suggest test cases, etc. This approach has worked well for the team. Their project is currently in production test at a user site in the Midwest, and only a few defects have been found, all minor. The users are happy with the functionality and with the "look and feel" of the new system.

My own project team has been lucky enough to hire some former users onto our staff. These people, our support team, provide a tremendous resource to the programmers. They have helped us analyze data entry transactions to deter-

mine how many VPLUS screens are needed for a given transaction, which fields are needed and how long the fields should be, where the fields should be placed, and how the softkeys should work. They have analyzed report layouts for field length, field placement and overall legibility. They have reviewed prototypes with current users in our various sites, and worked with the programmers to make changes to our software. Working with our user council, they have researched issues and department procedures which affect us. They have inspected our ES, and have assisted with specifying edits and data flows for our IS. Now that we are writing unit test plans, they are inspecting them and helping us come up with test data. They will do the same for our system test.

Because they are so involved, they have been able to write accurate and well-designed training and documentation materials for the new system. Our users are very happy with the team, largely because of the efforts of the support team. We expect the software to be very well received, as other projects we developed this way have been.

I hope that you can increase user involvement in your own software development process. Although we have found that programmers, unfortunately, think like programmers, users can help you see your software through the eyes of someone who works with your data entry screens 40 hours a week. The difference in customer satisfaction is dramatic. —Lisa Burns is a OMS System Manager for Hewlett-Packard, Palo Alto, CA.

How to improve your station in life.

It's easy.

From now until June 30, 1990, just trade in your VAXstation™ 2000 workstation and Digital will give you \$2,000 off the purchase price of our VAXstation 3100 workstation.

When you do, you're getting a lot more than just money off.

The VAXstation 3100 workstation delivers 3 to 4X the performance of the 2000.

The VAXstation 3100 workstation lets you run DECwindows™ software. It gives you a consistent user interface for accessing applications on your net-

work whether they're running VMS,™ UNIX®/ULTRIX™ or MS-DOS®. You choose what you want and it shows up on screen the way you want.

And, even though the VAXstation 3100 workstation is an upgrade, you can use all the same software you've been using on the 2000. With no rewriting.

Take the all-important first step toward improving your station in life. Call 1-800-343-4040, ext. 874 to take advantage of this special \$2,000 offer.

FAX FREEDOM

FAXLink/3000 Offers Fax Control At Your Fingertips

Few modern offices today are without fax machines. These little marvels of office automation seamlessly integrate a telephone, scanner, dot-matrix printer and modem.

Although the fax machine fits a very real office need, the stand-alone fax has two notable limitations. First, fax machines are paper-intensive devices. Even if the source input was originally electronic (a memo or document resident on a computer) you need to feed the fax at least two pieces of paper—your document and a cover page. Secondly, fax machines are single-user devices like the telephone. They do not provide the conveniences

we have come to expect in our batch programs, for example, unattended operation at off-hours or the queuing of faxes to different recipients. The most common approach to queuing faxes in our office is staff members standing in line.

Both of these limitations now are

Joel Martin

addressed in a combination of software for your HP 3000 and software and hardware for an MS-DOS personal computer. The software has been developed by Kaakontieto of Finland and supports a number of features that extend your ability to manage fax sending well beyond what's possible with a standalone fax machine. The hardware was developed by GammaLink (Palo Alto, CA). Both the software and hardware are available in Europe through Kaakontieto and in North America through Hillary Software (Spring Lake, NJ).

Through The Gateway

Hillary Software's FAXLink/3000 is software for both the HP 3000 (MPE V or MPE XL) and an MS-DOS compatible personal computer that supports the GammaFax fax gateway board. A fax gateway is a PC or other device that allows the sharing of a single fax line by linking a multiuser computer or local area network to the fax line.

FAXLink eliminates the intermediate paper step in sending a fax by directly connecting the HP 3000 to the fax gateway. Transmission of the faxes from the HP 3000 is managed by two background jobstreams and a session on the HP 3000 and a foreground program running on the personal computer serving as the gateway.

Faxes also can be scheduled for transmission at a future date or time, increasing the sender and receiver's convenience and reducing telephone charges. If the receiving fax machine is busy or if the fax transmission fails for any reason, then FAXLink/3000 attempts to retransmit your fax three times with a 10 minute delay between attempts. (Both the delay time and the number of attempts are configurable.) Faxes can be sent from PCs connected to the HP 3000 by first uploading the fax message to the 3000. (Certain restrictions in the formatting of the file may apply.)

A header or cover page for each fax sent is created automatically by FAXLink at the time of transmission. The cover page can be customized to display your company logo or another graphic. The

cover page also notes the originating office and office phone number, the return fax number and the number of pages included in the fax.

FAXLink allows you to create a fax directory (distribution list) of the names and fax numbers of frequent fax recipients. A fax recipient doesn't need to be added to your fax directory in order to

receive a fax. In addition to the recipient's name and fax number, the directory also can contain up to six lines of comments about each recipient. A single fax message can be sent to several recipients by selecting them from your directory, or by specifying the same message file after typing the name of each recipient.

Short on Ports?

Get it together with Equinox

A low-cost Equinox data switch lets many part-time users share expensive CPU ports on demand. Share modems, solve multi-host access problems and network PCs too. All for a lot less than a LAN.

Faxes can be sent through FAXLink in three ways: through an interface program developed by Kaakontieto, through HP DeskManager and programmatically through software you develop. (Faxes sent through HP Desk take advantage of your HP Desk directory.) Fax messages can be created with a standard text editor by using the minieditor supplied with the FAXLink interface program, or directly through HP Desk. FAXLink messages must be ASCII files of 80 bytes or less in length.

A tracking subsystem within FAXLink provides a history of faxes sent and scheduled. Tracking information is held for 31 days. This retention period is configurable if your fax traffic is particularly heavy or your audit requirements are particularly stringent.

The FAXLink software will support up to four outgoing fax phone lines from one PC. Support for a second phone line requires both a "bridge" board and a second GammaFax board. The third and fourth fax lines won't require another "bridge" board but each will require a GammaFax board.

With all the benefits I noted, you know that there must be a slight catch or two — and there is ... so don't throw away your existing fax machine(s) just yet. The two constraints you must accept are that FAXLink does not support receipt of incoming faxes, and outgoing FAXLink messages must be stored as ASCII text. (The cover page graphic is stored on the personal computer.) Faxes that include graphics or signed documents will need to be sent from your standalone fax machine in the standard fashion.

Installation & Set-up

The FAXLink/3000 product includes a GammaFax board and diskette for your HP Vectra or other PC compatible, two magnetic tapes or cartridges for your HP 3000 and five thin manuals. A version of the GammaFax board is also available for the IBM PS/2 or compatibles with the MicroChannel Architecture. One magnetic tape is for FAXLink and one is for KUDA/3000. KUDA/3000 is Kaakontieto's Universal Desk Adapter — a link-

ing system for all Kaakontieto products link to HP Deskmanager. Your PC will need a 20 MB hard disk, 640KB of main memory, DOS version 3.20 or later, a 1.2 MB floppy disk drive, 1 serial and 1 parallel port and AdvanceLink version

page.) Before starting the installation, keep in mind that the PC used as the fax gateway will be unavailable for any other usage.

Except for an untimely hard disk failure on the PC, I was able to install

Fax messages can be created with a standard text editor by using the minieditor supplied with the FAXLink interface program, or directly through HP Desk. FAXLink messages must be ASCII files of 80 bytes or less in length.

B.01.00 or later. If you don't yet have AdvanceLink you'll need to purchase it from Hewlett-Packard. The PC should be connected to a 9600 baud port on your HP 3000.

Installation of all of FAXLink's components is very straightforward, though the nature of the product requires a multistep install. Installation of the KUDA/3000 software and FAXLink/3000 software was easy. A slight amount of additional work is necessary to configure FAXLink to work with HP DeskManager. (We do not have Desk running.)

Installation of the FAXLink software on the PC is even more straightforward than on the HP 3000. After booting the PC with the supplied installation disk, a program will start that installs all necessary files on your hard disk. The only other steps to be performed are to edit the new AUTOEXEC.BAT file so that it contains the company name, phone numbers and other information specific to your site and to connect the GammaFax board to an appropriate phone line. (If you purchase FAXLink through Hillary Software the AUTOEXEC file will be customized for you based on information provided over the phone at the time of order. Hillary Software also can assist you with setting up a scanned image to be included on each fax cover

FAXLink on the two hosts without a hitch. The time you need to install all the HP 3000 and PC components should not be more than one half hour.

Regarding the set-up, the file CATALOG.PUB.FAX contains warning and error messages for FAXLink. It can be localized to meet your particular language, phrasing or security requirements. A stream job is included among the other files to "compile" the CATALOG.PUB.FAX file.

Test Results

After installing and setting up FAXLink, I logged on in a development account on our Micro 3000 XE and ran the FAXLink configurator program. I identified myself as the fax "super user" and added a new user ID. (The FAXLink super user is responsible for maintaining the table of valid FAXLink users.) The configurator program and the fax program used to send faxes operate in a similar manner. You're prompted to enter one of the valid commands assigned to the labelled function keys. Pressing the appropriate function key executes the command and brings you to the next level or prompt. Establishing a directory of users that includes user names (called "Sender IDs") and their passwords is very easy and very quick. The user name must be unique, but you are allowed up to 16 characters.

The 36 character sender ID need not be unique and can be the user's full name, title or any other entity.

After establishing a user ID for myself, I rebooted the PC (which then logged on to the HP 3000) and I started the two background jobstreams (MONITOR and FAXTRUCK) on the HP 3000. The background jobstreams ran without problems, though I would much prefer only a single job rather than the two. Rather than issuing two STREAM commands to start the jobs and two RUN commands to stop them, you'll probably establish a UDC command to start both jobs and another UDC command to stop both. (Neither job seemed affected by the timing of a start or stop command relative to the other job.)

Attempting to submit either of the background jobs while the first execution of the job was still running caused the second attempt to correctly fail with an appropriate error message.

I logged off and logged on again and following the instructions in the User's Guide I ran the fax program, created a small directory of fax recipients and tried

sending faxes. I found the process to be simple, fast and much less time consuming than waiting in line or addressing an envelope. I created fax messages with the supplied editor as well as with HP's EDIT/3000 and sent them without trouble. Setting up a fax to be sent at a specific time of day also worked with-

out a hitch.

One item that may pleasantly surprise your fax recipient is that the faxes you send from FAXLink will print on the recipient's fax machine at a much higher resolution than would be the case if a paper document was faxed in the standard fashion. The reason for this is that

the standard fax machine's input scanner can't support as high a resolution as its printer. By using a fax gateway that obviates the need for a scanner, you get the

F*AXLink can save you a substantial amount on telephone costs and will reduce the time it takes to send faxes.*

added benefit of greatly improved print resolution on the receiving end.

I was not able to test the FAXLink to HP Deskmanager interface but I was able to contact two users of FAXLink with HP Desk. Both characterized the FAXLink to Desk interface to be so easy to use as to be nearly invisible to HP Desk users.

The sample program to send faxes from within an application also worked without problems, as did programmatic receipt of a fax acknowledgement. The sample COBOL source code for programmatic access that is included in the FAXLink/3000 package is brief, easy to follow and easy to imitate.

Incorporating FAXLink in an application program should be an easy task for any skilled HP 3000 programmer. Programmatic access to FAXLink is being incorporated into an application at one of the sites I contacted about the HP Desk interface. That customer will be using FAXLink to broadcast sales information from their home office to 20 remote offices automatically. (The sales information could take the form of memos or reports from an IMAGE database.)

Documentation

The FAXLink documentation is thin but sufficient. There are five manuals — an Installation manual, an Administrator's Guide, a User's Guide, a Guide for the HPDesk User and a Programmatic Linking Demo. The Administrator's Guide could be improved with additional infor-

mation on the FAXLink databases (e.g., what parameters should be used to determine dataset capacities?) and the Programmatic Linking Demo would benefit from a customer case history or two. FAXLink is so easy to use that you probably won't need a user's manual after sending your first few faxes.

If your business sends a large number

of fax memos, letters, reports or other text documents, you may find that FAXLink can save you a substantial amount on telephone costs and will also reduce the time it takes to send fax messages. It will not entirely replace your standalone fax machine, but it will become a significant addition to your office automation tools.

All patched up?

A Program Manager That Provides A Convenient And Flexible Solution

Program Manager Plus

It's not often that I have come across a program that solves a need for a large number of end users and also is inexpensive plus easy to learn. However, Program Manager Plus from Lassen Software (Paradise, CA) is such a product.

While I've always acknowledged the convenience that program menus provide, I've also felt that the memory usage and set-up difficulties often offset any benefit they offer. Program Manager Plus however, uses only 14K bytes of memory while it's dormant, and installation and setup is simple.

Configuration

I tested Program Manager Plus on a Vectra LS/12 with 640K bytes of conventional memory and a 40-MB hard disc. The

program only requires 64K bytes of conventional memory, an 80-column monitor and display adaptor, a hard disc and a single flexible disc so it should run on almost any system.

The program as tested, Program Manager Plus Version 1.0, retails for \$79.95 and is not copy protected.

Installation

The process of installing Program Manager Plus is as easy as copying the files from the 5 1/4-inch floppy to a directory on your hard disc. Once the files are copied, you simply run a configuration utility and include the Program Manager directory in your path, and you're ready to go.

Depending on the number of menus you want to build and the features you

Miles B. Kehoe

Good.

Better.

Why.

Lotus 1-2-3™ is a fine piece of software. The trouble is, 1-2-3 only runs on personal computers. Whereas 20/20™ runs on a variety of platforms, including Hewlett-Packard *minicomputers*. In fact, it's the *leading* spreadsheet for multi-user systems.

With 20/20 on your HP system, everyone with access to the system has access to 20/20. So sharing models is easy. And since 20/20 also runs on other minis, mainframes, even PC's, your whole organization can standardize its spreadsheet operations.

20/20's advanced graphics are integrated with the spreadsheet itself, allowing you to display both simultaneously. Its consolidation capability enables you to consolidate multiple models. Its flexible ASCII import capabilities let you populate your spreadsheets with data from any number of sources. And since 20/20 is 1-2-3-like in its command structure, people familiar with 1-2-3 will find it easy to use.

You can demonstrate the value of 20/20 to yourself by taking advantage of our Evaluation Kit offer. Simply write Access Technology, Two Natick Executive Park, Natick, MA 01760.

Or, better yet, phone (508) 655-9191.

**Access
Technology**
A CompuServe Company
20/20™

may want to customize, you can be using Program Manager Plus in minutes.

Features

Program Manager Plus is a menu-based program manager not unlike HP's PAM program. However, it goes far beyond the limitations of PAM as a menu utility, and

offers a number of additional features as well.

Lassen Software assumes that there will be a System Administrator to do the setup and to customize the program for novice users. The number of features that can be customized by the administrator ranks Program Manager Plus among the most

flexible utilities I've ever seen. The menus, screen colors, access to certain advanced features and even the help screen text can be modified to provide maximum power and flexibility for the user.

This kind of flexibility makes Program Manager Plus useful in large companies where less experienced users want to access programs and data but don't know, and don't want to know, much about MS-DOS. However, the flexibility also makes Program Manager Plus ideal for system integrators and software houses who want to provide their user customers with menu-driven complete systems.

Program Manager Plus allows up to 32,000 unique pages of 16-item menus. Unlike PAM, each menu item can represent a program, a batch file, an MS-DOS command, or a link to another menu. I can't imagine anyone needing this kind of capacity, but I suppose it's good insurance that you won't outgrow the program's capacity.

The process of adding a program to a menu is interactive and very intuitive. Program Manager Plus leads you through the required information for each type of menu entry, and has a feature to let you test an entry before you save it. For those who have trouble remembering if a particular program is a COM or an EXE file, Program Manager Plus features a "search" capability that lets you search for a program or file while adding the menu entry: No more install programs or file manager programs are required.

Because Program Manager Plus is designed to help rather than hinder, you can access programs on the local disc or over a network without being concerned about where the program resides. In essence, any program or batch file you can access from MS-DOS you can access from Program Manager Plus. And because it's an application and not a TSR program, you won't have any problems related to using this utility with any of your other programs or TSRs.

Menu entries aren't limited to executable files, either. The ability to link an entry on one menu to another menu is a feature beyond the capability of PAM. In

Conferences."*

—LOYD TARVER—
EXECUTIVE DIRECTOR,
WORKSTATION MARKETING
INTERGRAPH CORPORATION

Because in every major market of the world the Engineering Graphics Series of the ICCs give the desktop engineering professionals what they need to know about

graphics workstations, application software, color printers/plotters, monitors, image processors and other associated products.

In one day, through product demonstrations and technical seminars, attendees learn the latest technology and

discuss their application requirements. Manufacturers have the opportunity to meet one-on-one with volume buying large end users, OEMs and systems integrators to demonstrate their products and reinforce their commitment to customer support on a regional basis.

"By Invitation Only," guests attend free of charge. Manufacturers share the low cost with a minimum investment of time and sales effort.

addition, you can assign one or more passwords to any menu item and control access to any menu screen or program: If the user doesn't know the password, he can't access the menu or program.

Program Manager Plus allows the administrator to limit access to MS-DOS. In addition, the program can be installed so a user doesn't have the ability to exit the program, insuring the Program Manager Plus will be the interface the user always sees.

The setup menu, where the administrator does most of his work, also can be protected by a password, helping insure that a user can't make unauthorized changes to the system.

Finally, these security features make Program Manager Plus ideal in environments where more than one user must share a PC. Therefore, an accounting user authorized to enter data and review financial records can share the computer with someone who shouldn't have access to that data.

The utility also has a logging feature that lets the administrator review actions taken by any user. This includes a record of which programs were used and what actions were taken at the system running Program Manager Plus. This is great for verifying system security, as well as for backchecking when an error occurs to see exactly those programs used before a problem occurred.

Program Manager Plus features a concise user interface that shows the first menu screen and the time and date. It also can be displayed in U.S. or European

formats, a nice feature when system integrators want an international product.

Finally, there is a screen saver utility that can be configured to erase the screen after a period of inactivity to prevent burn-in common to systems that run a single menu system all the time.

Improvements

Even though program Manager Plus serves several useful needs, there are some features I'd like to see in future versions.

For example, a useful utility that could be used by the administrator to print a map of the menus available to any user. This allows a sanity check of the entire menu tree to verify that all active menu entries do, in fact, lead to a valid menu or program. When there are a small number of menus involved, it's an easy task, but a large menu tree could easily become awkward and unwieldy.

I'd also like to see a way for access to MS-DOS to be controlled by password. Program Manager Plus does allow the administrator to block access to MS-DOS, but this blocking also controls the ability to exit the program completely. If I could launch COMMAND.COM without having to specify a command or batch file to run, I could do this using existing features. I just couldn't get the setup portion of the utility to accept a blank command line.

Finally, I'd like to see Program Manager Plus written such that, like PAM, it could be installed as the primary DOS shell. Many of the features help provide security and tracking of all steps taken by a user, but a user can either accidentally or

Program Manager Plus

SYSTEM REQUIREMENTS: 64K bytes of conventional memory, 80 column monitor and display adapter, a hard disc drive and a single flexible disc. IBM PC/AT or compatible PC. MS-DOS Version 2.1 or greater. Optional mouse.

PRICE: \$79.95; Site license available for quantity purchasers.

Take A Step To Meet Customer Demand

Porting Inquiries

product from one language/computer/operating system to another.

Ports are initiated for a number of reasons, all related to one business imperative: customer demand. Because UNIX is relatively new to the business marketplace, many companies are contemplating porting their product from an "older" operating system/computer to a UNIX system computer.

Deciding to port is a big step. Most businesses, unfortunately, have no idea how big. Let's answer a few questions that must be asked before porting the software product.

Will the ported version entirely emulate the initial version?

The answer is a long-term strategy decision. To "split" the two versions implies an increase in support costs: two sets of documents must be maintained, two sets of features must be supported, customers will want an upgrade path for their older systems, which becomes more difficult to provide as the two products grow apart.

As part of this decision, you may consider the possibility of abandoning the old platform in favor of the new. Usually, this is not a good idea: The collective blood pressure of your customer base may increase if the product they just purchased is suddenly made obsolete.

Do you maintain backward compatibility?

Backward compatibility implies that only a single version of your product's source code is maintained and modified. This version of code can compile and execute without modification on either the origi-

nal system or the (porting) target system.

Backward compatibility decreases future development costs: A new feature only has to be written once and only one set of documentation is required for the new feature. Once the initial port is completed, the entire porting process can

Deciding to port is a big step. Most businesses, unfortunately, have no idea how big.

be automated so that future ports of new features require only two or three hours. Additionally, support and training costs are also smaller.

However, testing becomes more time-consuming because any change to the source code requires testing on both systems.

If you plan to add the same features to the product on both the original and the target systems, you should maintain backward compatibility during the initial port.

How much does a port cost?

Obviously, the answer to this question depends on the size of the product and the cost of your employees. Programmers familiar with both the current product and the target system should be able to convert between 10,000 and 20,000 lines of code per man-month during the initial phase of the port. Once the initial port is completed, new features can be ported at the rate of 5,000 lines per man-day.

In addition, consider the time and money required for the following port-related expenses: documentation for the new product (to differentiate the new

manuals from the old or to remove the system-specific information from the original documentation), training costs for your employees, system costs, additional customer support costs, marketing and advertising costs (your advertisements, brochures, etc. must be updated to mention UNIX), training costs for your customers (a new training course must be created or your old training materials must be updated). This list is not complete. Other costs may occur for your particular product that may not occur for porting a different product. Plan carefully.

Do you stay with the same language?

Sometimes this decision is based not only on the current porting requirements, but also future porting desires. If the product is written in HP 1000 FORTRAN, porting to the HP 9000 Series 800 is straightforward and tools are provided by HP to assist in the port. However, porting from HP 1000 FORTRAN to VAX/VMS FORTRAN can be a nightmare.

Carefully analyze the current code against the target language to determine whether changing your source code language is your best choice. If so, tools may be available to convert code from one language to another (for example, FORTRAN to C). Investigate these tools if staying within the language will require more porting time (both now and in the future) than you want to spend.

The bottom line: The cheapest and easiest port will be the one in which you add or change the least code.

Do you have enough time to perform the port?

Or, more accurately, do you have enough time to perform the port correctly for the long-term requirements of your business?

Another Night of Automatic Network Backups

When you buy Delta, you buy peace of mind. More than just another 2-Gb tape drive, the Delta Microsystems 2000T subsystem includes software and the best technical and hardware support in the industry. Delta's array of utilities includes the *bud* utility which lets you set up a complete backup operation for your entire network, one time. From then on you just insert a tape and *bud* carries out the scheduled backup operation. Other Delta utilities can be used to pre-certify your tapes, monitor and maintain data integrity, maintain a table of contents and exercise the drive. Delta's custom driver was developed especially to take advantage of the unique features of the 2-Gb tape drive. When you buy Delta, you buy a complete solution.

Delta's commitment to excellent customer support means that you not only can talk to a trained customer representative, but you also have access to the authors of your drivers and utilities. Delta develops all its software in-house and is committed to supporting future operating systems and architecture. When you buy Delta, you buy support.

We know how valuable an engineer's time is, and how costly down-time can be. That's why, if you call Delta with a

suspected drive problem, we'll ship you a replacement overnight, free of charge. When you buy Delta, you buy service.

Delta is consistently at the forefront of developing technology. Delta supports a full range of SCSI peripherals including WORM (Write Once Read Many) optical, CD-ROM, Winchester, erasable optical and DAT (1-Gb helical scan) tape subsystems. The 2000T tape subsystem is supported on a range of workstations including those from Sun, Hewlett-Packard, Silicon Graphics and Solbourne. When you buy Delta, you buy versatility.

Some of the most respected names in the industry, including Sun, Hewlett-Packard, and AT&T, buy Delta. When you buy Delta, you're not alone.

Call for information about support for other platforms and new peripherals.

Livermore, California 94550 (415) 449-6881

Your Disc Cache Manager

The Disc Cache Optimizer from CT&S is an ideal manager for the brains in your computer: it is a tiny program and you hardly notice its presence. It is usually asleep, but always alert.

When HP Cache is running, DCO controls the parameter setting of HP Cache dynamically. Depending on the system load it switches caching on or off. DCO controls the amount of internal RAM memory used for caching and dynamically adjusts the size. It checks caching on all discs, measures their performance and decides whether caching should be disabled on certain discs. With DCO, you have always achieved an optimal HP Caching system. So you improve your system throughput by 5 to 30%.

DCO was developed by HP specifically for the HP 3000 and is used by HP EDP departments all over the world. Its quality is mainframe. But its price is micro.

page

If no one in your company has enough experience with the target operating environment and you are under time constraints, send your employees to training classes and hire *good* consultants to perform the port. Because a port is usually a one-time expense, hiring experienced consultants for this task is a good use of money.

If you have the time, allow at least four months for your employees to learn the new system and to map out the porting strategy *before* beginning the port.

Too many ports fail because of inadequate understanding of the target system's features and the ways in which users work with the target system. HP-UX users do work very differently from VMS users. Understanding these differences will decrease your future support and training costs.

A badly executed port will become a continuous money drain on your company. Good preparation can prevent this.

When will your new equipment appear?

As many HP customers know, obtaining a new system can require months unless the customer is influential enough to increase the speed of the ordering process. Plan early. If you don't have the time to plan early, check out the dealers of used or rental equipment that advertise in your local area or in this magazine.

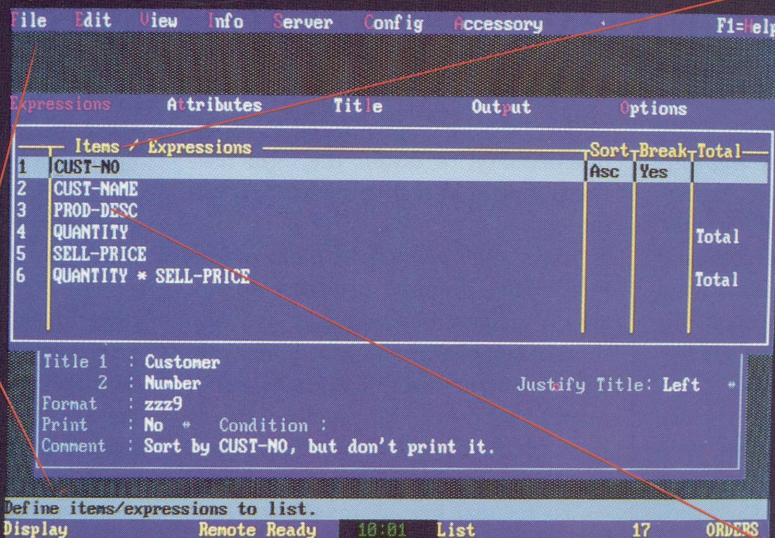

Any time you obtain equipment from vendors other than HP, you are not dealing with HP support or service. Be aware of the vendor's service and return policy before signing anything.

The most important point is that good planning is the foundation for a good port. Once you've laid this foundation, the next step is to determine the techniques for porting the code from one system to another.

Next month, I'll discuss possible technologies for porting code from one system to another. —*Andy Feibus is president of Processware Inc., Atlanta, GA.*

Looking for Better Access to Your Information? Look to VISIMAGE PC.

Your End User's Window to Report Writing and Downloading.

PC End User Solution

VISIMAGE PC creates a friendly, yet powerful, environment of pull-down menus and pop-up windows for your PC users connected to the HP 3000. Powerful calculation and conversion macros can be predesigned for end user automation and maximum ease of use.

Terminals, Mac's, and PC's

VISIMAGE 3000 runs on all HP terminals, Macintosh computers, and PC's running in terminal mode.

Custom Tailored Reports

Create simple lists or extensive reports from multiple databases with multiple datasets, focusing on specific ranges and series of items.

Automatic Downloading

Automatically retrieve and import data into almost all PC and Macintosh Applications.

Tailored to Many HP 3000 Applications

VISIMAGE has been customized for use with many popular HP 3000 applications, including manufacturing packages like AMAPS and ASK's MANMAN/OMAR systems.

Powerful Features

- Multiple Dictionary Capabilities (including HP, COGNOS and your own.)
- Automatic links between multiple datasets and databases.
- Runs on any network that supports Reflection
- Built-in Omnindex interface
- Access IMAGE databases, KSAM, MPE, and SD Files
- Easy multipass reporting.

All this and more!

RDBMS

Fabian Pascal

The Benefits Of The Relational Approach Are Often Misunderstood

Relational Fidelity

Despite the clarity and simplicity introduced by the relational approach, its properties and practical benefits are misunderstood and distorted in the market. So much, in fact, that the use of the term "relational" has become totally meaningless.

Some of this is caused by the existence of traditional products, techniques, skills and inertia. Given the fundamental differences between the relational and procedural approaches to database management, new DBMS engines would have to be designed to provide the practical benefits inherent in the model. This is expensive for vendors, and would invalidate many existing user applications and skills. Neither established vendors, or practitioners vested in traditional database environments are comfortable with this (relational benefits notwithstanding).

Moreover, a major purpose of the relational approach is to shift the burden of *managing* databases from users to the DBMS. The model delineates the *data-base* functions that should be handled centrally by the system, leaving much less work to the user. This means that much of the users intelligence must be transferred to DBMS products.

Developing a relational DBMS is, therefore, a nontrivial task and much more demanding. Experience and intuition no longer are sufficient, as DBMS designers must know and understand the underlying mathematics and logic. This is usually discounted by some vendors, primarily for expedience. They usually resort to simplistic solutions such as making their existing products "appear" relational, extend them with limited and

frequently poor implemented relational functionality, or distort the term relational to suit what they already are selling.

Even some vendors of more recent, relationally oriented products do not always understand the model, and stop short of complying with its requirements. Very important features are eschewed or poorly supported, and simplistic extensions are developed without any regard for the relational principles or generality.

To try and resolve incompatibilities between traditional, proprietary database environments, the industry is heavily engaged in standardization efforts. ANSI, ISO, X/OPEN, OSF, the Federal procurement bodies, and IBM through its Systems Application Architecture (SAA), have set up groups and committees to define database standards, primarily around Structured Query Language (SQL), a relationally oriented language developed by IBM.

The relational model is a natural candidate for database standardization. But, unlike the relational model, these vendor-based standards are geared primarily to protect existing products, not users. The outcome is the lowest level of political consensus between the various participating vendors, each of which already has traditional or different SQL implementations in the market. Indeed, the

sheer proliferation of different standard bodies (yet two new specifications for open access SQL have just been defined) is a contradiction in terms that reveals the fundamental flaw of the approach.

The SQL specifications generated by these bodies frequently ignore relational principles, aren't very coherent and have functional weaknesses. Moreover, they are very lax, allowing vendors to develop diverging products without losing their claim to standard compatibility. They also trail (rather than lead) the market, forcing vendors to extend products, in their own way, thus making consensus even more difficult in the future.

Under these circumstances, making database decisions becomes extremely confusing and difficult. And this is the precise problem that the relational approach was devised to eliminate. Users face a proliferation of DBMS products, all of which claim to be relational and compatible with all of these (different) standards.

Knowing and understanding the relational features already described is a crucial prerequisite for seeing through the misinformation. But remember, the features only define *basic* DBMS functionality. Many other functions are required in practice, and the model can (and was intended to) be extended for usability. For example, recursive operations would

TABLE

be useful for bill of material "explosions," and support of complex data types such as text or graphics needs to be defined in the same rigorous way. And, as we shall see, the issue of missing data also

same level. They form a sort of functional hierarchy, where features and rules lower in it are necessary for compliance with higher level ones (i.e., the latter are dependent on the former.) Because the

The relational model is a natural candidate for database standardization. But, unlike the relational model, these vendor-based standards are geared primarily to protect existing products, not users.

needs to be resolved by research. Any such extensions *must not* (1) be ad-hoc and arbitrary, or (2) defeat or violate the basic features or basic principles.

Because of all this, some additional clarifications were necessary to guide in any genuine attempts to extend the model and make it more useful, as well as to implement it. Moreover, there are some other aspects that are *implicit* in the features, and necessary even if not directly covered by them. Yet others are not purely relational, but must be supported by the DBMS for completeness.

For all these reasons, Codd has supplemented the features with a basic set of rules (see Table 1) that a DBMS must obey if it's to provide the practical benefits inherent in the relational model.

They were intended to supplement the relational features in guiding standard setting bodies, vendors and users in specifying standards for, implementing and evaluating relational DBMS.

All 12 rules originate in, and are subsumed under one, most fundamental rule. Rule 0, the Foundation Rule, defines the overall thrust of the relational approach. The 12 rules then describe in more detail how the fundamental objective is to be achieved.

What hasn't been made clear is that the features and rules are not all at the

features and rules are highly interdependent, it isn't possible to develop DBMSs which comply with only some, without affecting the support of the others.

The somewhat abstract formulation of the rules makes it difficult to see their practical implications. However, the implications are crucial for usability. But because the rules also are intended to defeat unjustified DBMS claims of relational fidelity, they have become controversial, with many discounting them as "irrelevant" for practical purposes.

So, starting next month, instead of just regurgitating the rules in their numeric order (as they are usually approached), I will place them in an overall functional context, and demonstrate how they help protect user investment in a DBMS.

Because it's difficult to explain individual rules in isolation of one another, I will divide the rules into some logical groups based on some basic functional aspect. I will explain the meaning of each rule and the consequences of the rules not being complied with by the DBMS. Also, I will discuss the practical implications for the users. — *Fabian Pascal is president of micro-paSQL, an independent Washington DC consulting firm specializing in relational database management and SQL on the PC.*

PC TIPS

Miles B. Kehoe

The Evolution Of The PC ... And Where It's Going

Past, Present And Future

reluctance to look back and the temptation to look ahead. For HP, the past and the present can only lead to a strong future.

The Past

In 1980, HP sold the HP 3000 with MPE and IMAGE. For enough money, you could get as much as a million bytes of memory! Of course, terminals ran at 2400 baud, but IMAGE and FORMS were really unique and it looked like HP could do no wrong.

In the terminal market, HP's hottest products were the Z-80 based 2645 and 2647. For a premium price, \$5,000 to \$7,000, you could get a great terminal with eight pages of display memory. The 2647 had high resolution monochrome graphics and an optional floppy disc drive.

Printing technology was just starting to enter the laser age, and the HP 2680 was one of the leaders if you had \$100,000 to put down. Despite the cost, it was the start of a revolution.

In the PC world, you could buy a small computer with 16K expandable to 64K for under \$2,000. HP was on the verge of introducing the HP 85, billed as an instrument controller, but seen by many as HP's first entry in the PC market. It was to be the first in a long series of attempts to make a successful personal computer. A show special at the West Coast Computer Faire was 16K RAM for your Apple II for \$95.

The UNIX operating system wasn't very well known and was used only inside of AT&T and some progressive colleges and universities.

The Present

Today, you can buy a PC for under \$2,500 and it has more memory than the

HP 3000 could support in 1980; has better graphics resolution in color than the best graphics terminals had in black and white; and can run programs that were undreamed of in 1980 (Lotus 1-2-3, Graphics Gallery and NewWave).

Workstations, virtually unheard of in 1980, offer powerful desktop solutions to problems that required a mainframe system. HP has spent millions to develop HP-PA, an architecture that the company says will last through the end of the century.

The HP 3000 and MPE have successfully migrated to the HP-PA architecture and offer a growth path to HP's large installed base. MPE is a mature operating system and continues to be the environment of choice for customers with database and transaction processing requirements.

As more major customers begin to look for industry standards, the HP-PA family of systems should evolve into a full line of compatible products.

Because of its early association with Cannon on the HP 2680 Laser Printer years ago, HP enjoys the enviable position as the industry leader in PC peripherals. HP continues to expand in this market with personal laser printers and inkjet technology printers for Vectras and now for Apple's MacIntosh. Consider that HP probably generates more income from its laser printers than from any other product line in the company — this from a product that retails for under \$2,500.

After years of slow, steady progress, HP is also a leader in the personal computer market. The Vectra is a competent family of systems and enjoys success not only in HP's direct sales but also through full-service dealers. The success of the LaserJet and the decision to make a fully compatible PC are finally paying off.

HP has introduced a number of software products for the Vectra and for any

IBM AT compatible system: Drawing Gallery, Executive Memomaker and AdvanceLink are my favorite.

HP is also on the verge of making a big splash in software with the introduction of NewWave.

It offers a chance to get the computer to work the way people do. You can mix text, graphs and numbers in the same document without switching between applications.

Perhaps the biggest single change in HP in the last decade has been the shift from proprietary products to industry standards. HP has been a prime mover in the Open Software Foundation; in the EISA group to create a standard interface in the PC world; and generally has positioned itself as the company committed to standards.

The Future

There are all sorts of technologies that hold promise for the future, but predicting which will succeed is purely a guessing game.

Alternate methods for entering data may become more practical but I think the keyboard and mouse will remain the primary methods of computer interaction. After all, while voice input and

output may be handy at home, it could cause considerably more noise and confusion in a work environment.

The advances in optical discs and video technology seem to point to a much closer integration of computers and video. Video mail, animation, and even interactive video-conferencing may also gain popularity.

New communications technology will mean the end of the modem as we know it. The telephone company will provide high-speed interfaces for serial communications with basic telephone service, and may even provide a connection for a community-wide network. Information you need to dialup to get now will be available online thanks to digital communications technology.

Combining the advances in communications and in video technology may finally make telecommuting a reality. If you can do your work, meet with co-workers, and attend a meeting without leaving your home, you may be able to be more productive at home than at work after fighting rush hour traffic.

"What if..." simulations will become even more powerful. Giant textual databases and new retrieval technologies will make multigigabyte databases a snap to browse.

The Risks

As the new decade begins, HP enters a critical phase in its history. There are challenges in several areas, not the least of which is to extend the commitment to industry standards throughout all product lines. The HP 3000 will assume a smaller role in the future, and only time will tell whether the push for commercial customers for HP-UX can make up the difference.

In addition, there are major new competitors in several of the most profitable markets such as desktop laser printers. HP can't afford to rest on its successes of the 1980s.

NewWave marks a new opportunity for HP to improve on the future of computing for all of us. Without a major effort to recruit software vendors and to make NewWave truly multiplatform, HP may discover that its effort has been in vain.

Right now there is a dedicated group working to accomplish these goals: I hope they get the management support to succeed.

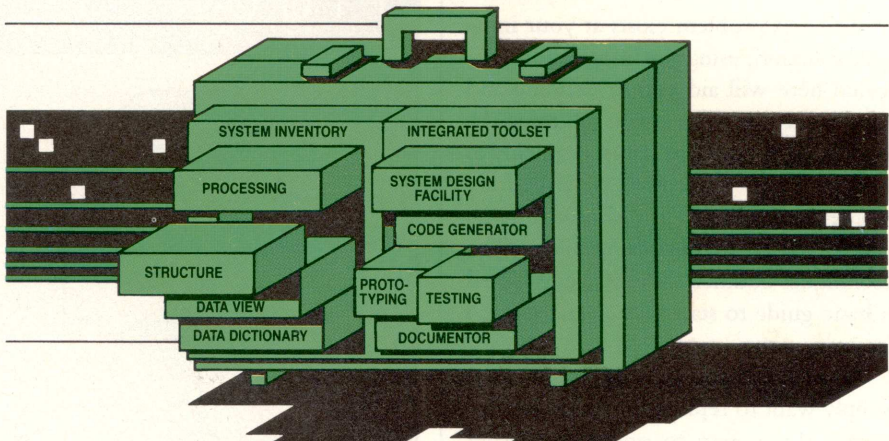

Before closing, let's speculate about what my PC will be in 10 years. It's based on the 60 MHz Intel i2000 RISC processor, has 25 MB of main memory, and runs OS/4. The internal disc drive is one of the new 25 GB optical drives, and I have the Community Net connector that lets me

tie into virtually any information I could want. The monitor is only 2048 x 2048 pixels with 24-bit color, but it's all I really need. I'm going to buy the video interface that includes the camera scanner as soon as I can find one for under \$500. —Miles B. Kehoe is an online support manager for Verity, Inc., Mountain View, CA.

A Problem Solving Guide For Defining And Isolating Desktop Computer Problems

Desktop Computer Troubleshooting

The majority of desktop computer system problems don't

require professional technical help to return the computer to operational status. A nontechnical user can isolate many malfunctions to the unit level (e.g., computer, disk drive, printer, monitor), and then decide if it is a do-it-yourself project or one for a professional repair service.

When a problem exists at your individual station, using the information provided here will aid you in defining and isolating that problem, then returning the system to operational status as quickly as possible. The procedures described are suggestions only. They should not be considered as the only methodology. The techniques outlined should be considered a basic guide to start with, build on and improve upon.

Most desktop computer system users simply want to replace the failing unit to return the system to operation, rather than call their service company to complete the repairs or take the problem unit to a qualified repair facility.

Only those users possessing a basic knowledge of electronics and computer systems should continue troubleshooting the problem past the defective unit point to the subassembly or printed circuit board (PCB) within the unit. This level of troubleshooting is better left to a trained technician.

Desktop Computer Troubleshooting

Troubleshooting a personal computer or workstation is simple when you adhere to a logical, definitive plan. Troubleshooting consists of two levels: problem

determination and fault isolation.

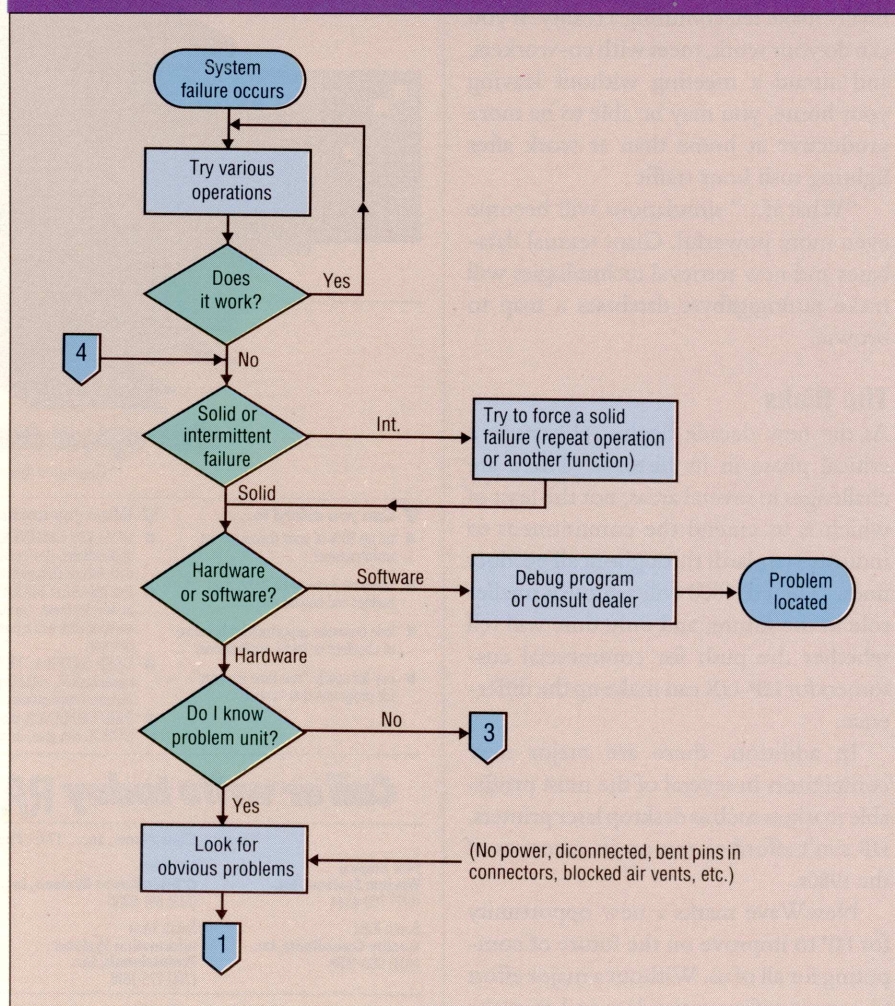

LEVEL I. Problem Determination

First, investigate the circumstances causing the problem to occur. For example, does the problem occur only when a particular operation is attempted, such as a disk save to drive A or an output to the printer?

Once you figure out what is and isn't working, try to classify the problem as a solid failure (one that happens every time the same operation is attempted) or an intermittent failure (one that occasionally happens when the operation is attempted).

The problem may occur only when certain software (programs) are run. For

FIGURE 1.

The following flowchart summarizes the troubleshooting procedures to take.

Experts in the HP community will prepare you for
the management and technical challenges of the 90s.

CIRCLE 150 ON READER CARD

FIGURE 1 . . . continued

instance, an error occurs every time you try to execute a SAVE command in WordPerfect, but a SAVE operation under LOTUS 1-2-3 executes to completion. In this case, a program or media (diskette, disk, tape) failure may be the problem.

Investigate the functions that do and do not work by trying out as many operations as possible and noting the result. This is the most important step in troubleshooting because you must determine exactly what is wrong before you can isolate the cause and correct it.

Once you think you have accurately defined the problem, try to logically de-

cide which unit is most likely to be at fault. For example, if a disk load from drive A fails, but a disk load from drive B works, chances are pretty good that drive A is at fault and not the computer. Likewise, if both drive A and B load operations fail, the computer or disk controller could be at fault.

Here are some Level I procedures to use in defining a possible problem. When a failure occurs, do each step below until the failure is remedied or all possibilities in Level I have been exhausted. After any step that you take an "action" (such as resetting a switch) retry the operation that previously failed to see if the "action" resolved the problem. This is the best way to finally pinpoint the prob-

lem-causing condition.

- Redo your failed operation again (retrace your procedure); it may have been an operator error.
- Check that all switches and settings are properly set.
- Power the system down and back up again (this often solves simple PC problems).
- Try using the back-up copy instead of the diskette you were using when the problem occurred (if it works with the back-up copy, it's likely that the problem is in your media — if so, make a back-up of the back-up copy and throw the old original away).
- Check all plugs and connections to

make sure they are in tight (the system should be powered down when you do this). Check each for corrosion, bent pins (are they touching each other?) and broken or missing pins (did the pin fall where it could cause damage?).

■ While the system is still powered down, check the fuses for that room. Plug a lamp, calculator, typewriter, etc. into the outlet you use for the system — does the outlet work?

■ Check each component of the system to see if it's abnormally hot. You may need to adjust room temperature, close the drapes if the sun is shining directly on some equipment, or power down the system and wait an hour before trying again.

■ Check the vents for blockage and dirt.

■ If you don't have an antistatic mat, use some antistatic spray in the room.

■ Of course, if you have extras of any equipment (or two disk drives), attempt the procedure again, using the other identical piece of equipment. This is an excellent way to test whether it is the equipment or the media.

The decision as to which of the foregoing you want to try first is up to you and will vary with the situation. Above all, when troubleshooting, *be logical!* For example, if your disk drive won't save something that has taken you an hour to enter, the last thing you want to try is powering down the system.

At this point, you may have a good guess as to the problem unit. If you cannot reasonably decide which unit is failing, proceed to Level II.

Level II. Fault Isolation

Problem isolation may require the running of a diagnostic. For example, if you are using an HP-Vectra, a diagnostic diskette is supplied with your machine. Similar test routines are supplied and/or available for other types of PCs and workstations. Most diagnostics check the operational status of the computer, disk drive(s), keyboard, monitor and standard printers.

Refer to the operations manual that came with your desktop for instructions on loading and executing the diagnostics.

Running the complete diagnostics will normally isolate the fault to the unit level. If the diagnostic gives no indication of a unit problem, the most likely reasons are:

1. Problem is caused by a software error.

To check this out, run a back-up copy of the program that failed. If it works, the media (diskette, disk, tape) originally used is damaged. Make another copy of the back-up and destroy the faulty copy.

If the back-up copy also fails in the exact same manner, the program probably needs debugging (editing and correct-

ing). (If the program has accessed a non-standard unit, the unit must be tested to confirm a program error.) If it's a store-bought program, refer the problem to the dealer where you purchased it.

2. Problem is caused by a nonstandard unit.

The unit that is faulty isn't tested by the supplied diagnostic program. Refer to the manufacturer's manual, the dealer from whom you purchased it, or consult your service vendor for advice.

TABLE 1.

Symptom	Probable Cause	Action To Take
No display	1) No AC power. 2) Cable not connected. 3) Brightness control is fully counterclockwise. 4) Contrast control is fully counterclockwise.	1) Check switch, fuse, power connection, wall outlet working. 2) Connect and secure cable. 3) Turn control clockwise to desired setting. 4) Turn control clockwise to desired setting.
Display on, but it cannot communicate with PC	1) Cable loose. 2) Keyboard key stuck in pressed (down) position.	1) Secure cable. 2) Release key; check for foreign material between keys.
Display characters are distorted.	Contrast control is fully clockwise.	Turn control to desired level.
Random or unidentified characters are displayed	1) Baud rate switch set to wrong rate. 2) Parity switch set to wrong position.	1) Set switch to proper position. 2) Set switch to No Parity.
Random characters appear while operating with a modem.	Noise on phone line.	Try another phone line or reestablish phone connection (redial).
Paper continually comes out of paper tractors on printer, or paper feeds improperly	1) Paper not aligned properly. 2) Paper tension too loose. 3) Improper paper feeding path.	1) Align paper so it is straight. 2) Adjust tension so paper is tight (refer to printer's manual). 3) Feed path should be free of obstruction, straight with no pull on paper.
Miscellaneous characters (garbage) prints out	1) Incorrect settings in printer or computer. 2) Poor printer cable connection or bad cable. 3) Printer not adjusted correctly.	1) Check settings. 2) Check that both ends of the printer cable are securely connected and tight; if needed, replace cable. 3) Call repair service.
Characters print partially or not at all.	1) Ribbon is bad or used up. 2) Ribbon is improperly installed. 3) Cable between printer and system unit is not connected securely.	1) Replace ribbon. 2) Check for proper installation (ribbon path is correct with no obstructions). 3) Power system unit and printer OFF, reconnect cable and tighten securely.
Characters print lightly, sometimes printer fails, sometimes characters are missed.	Printing head too far from paper.	Readjust print head.
Uneven spacing between lines of printing.	Paper advance mechanism needs adjustment.	Call repair service.

4GL Development Tools Offer Productivity Gains

Unify Corp. introduced ACCELL/SQL for ORACLE, a high-performance, 4GL application development system designed to improve the programmer productivity of Oracle DBMS users.

ACCELL/SQL for ORACLE provides Oracle users with both a full featured 4GL and a powerful applications generator that can cut programming time and code by up to 80 percent. The development tools form a completely integrated application interface to an existing Oracle DBMS, while also allowing users the flexibility to use the Oracle SQL*Forms generator. In addition, ACCELL/SQL for ORACLE has a Cooperative Processing option that offloads user input-output processing from a UNIX host to DOS-based PCs.

Prices range from \$1,500 to \$140,000 depending on system size and configuration.

TGS Introduces Phigs Command Interpreter

Template Graphics Software Inc. (TGS), developer of FIGARO+ graphics software, has introduced its PHIGS Command Interpreter (PCI), a front-end option to FIGARO+ that lets you enter and execute FIGARO+ commands interactively without programming.

PCI can be used in prototyping, debugging, as a learning tool for 3-D application programmers, and to create complete application programs.

PCI accepts free-form input, prompts the user for missing information, and can read script files of PCI commands that correspond directly to FIGARO+ commands. PCI can be called as a subroutine by a FIGARO+ application program or it can be used as a standalone program. Like FIGARO+, PCI interfaces to both the FORTRAN and C language bindings included in the standard FIGARO+ product.

PCI is priced from \$750 per copy on workstations and from \$2,000 per copy on minicomputers, or as a part of the Application Developers Kit.

SPEEDTEST/3000 Supports Native, Compatibility Modes

Intelware Systems Ltd. announced the MPE XL implementation of its SPEEDTEST/3000 productivity tool. This version supports both native mode and compatibility mode programs on the Spectrum.

SPEEDTEST/3000 version 2.0 provides a productive method for testing programs that use TurboImage databases. First, it eliminates the need to create and maintain test databases. It allows you to test with any database as the source of data without changing or corrupting it. This means that you now can test with production databases.

Second, SPEEDTEST/3000 provides new access modes to databases and a full trace facility that increases productivity and the reliability of programs.

SPEEDTEST/3000 version 2.0 supports all compilers and 4GL on the Spectrum.

Time Management Tools Available On HP-PA

Crosswind Technologies (Felton, CA) has ported its Synchronize workgroup time management tool to HP-UX multiuser host systems. The X system includes a graphical user interface and a mechanism for distributed processing across a network.

Synchronize allows a user with a display station (a client machine with a mouse) to schedule meetings, distribute agendas, write personal to-do lists and send out reminders. A Day-at-a-Time View shows the day's events, reminders and to-do items. Because each user's appointment calendar is kept in a common database, any workgroup member can use the Events Editor to review other members' available time in order to schedule meetings. The Events Editor also allows group members to respond "yes" or "no" to indicate whether or not they will attend a meeting.

In order to use Synchronize, a workgroup must have at least one server, a UNIX machine capable of running X programs

PC-EDIT/1000

EDIT/1000 on Your PC

Now the best editor on the HP/1000 is available on your PC. PC-EDIT/1000 is an implementation of Hewlett-Packard's Edit/1000 for MS-DOS users.

PC-EDIT/1000 is designed for the computer user who works on both personal computers and Hewlett-Packard's HP1000 Computer System.

PC-EDIT/1000 takes advantage of the capabilities of the personal computer providing features currently not available on HP's EDIT/1000.

PWM

PAUL W. MILLER, INC.
27 Rambling Brook Drive
Holmdel, New Jersey 07733
201-946-0440

PC-EDIT/1000 provides the features that HP EDIT/1000 users have come to expect: Screen and line modes, interactive and batch, powerful character string search and replacement commands are all available. The command stack window gives the user access to the last 20 commands and the UNDO command reverses the last line mode command executed.

PC-EDIT/1000 also provides the user with new features: Left and right scrolling in screen mode, automatic screen and line mode tab compensation, and screen mode brackets that can not be over-written.

PC-EDIT/1000 runs on PC-DOS or MS-DOS version 3.2 or greater. PC-EDIT/1000 requires 512K bytes of RAM and a hard disk or two floppies.

Single copy price of only \$295. Available on both 3.5 inch and 5.25 inch media.

Like-new HP Portable Plus:

~~\$2795~~ Only ~~\$1295!~~ used \$895

**One of the greatest computers ever made—
at the lowest price ever offered!**

- **One-year guarantee**
- **30-day trial**
- **Free technical support**
- **Free shipping** on all U.S. orders
- **No sales tax** if you're outside Iowa

Ideal for:

- **HP3000 users:** Use a Portable Plus as a terminal—like 4,000 HP sales reps do!
- **IBM PC/compatible users:** Add a Portable Plus to your system—and take your work anywhere!
- **HP110 users:** Now is the time to upgrade to a Plus! (Trade-in allowances are available.)
- **Portable Plus users:** Get additional Pluses for your company, friends, or family—at the lowest prices ever!

ALSO: HP Portable software, ROMs, and accessories—up to **77% OFF** when you buy a Portable Plus from us!

We also buy and sell used HP Portable and HP150 equipment. We have **Word-Perfect** for the HP150 and Portable Plus—and dozens more programs as well!

European customers: We have European keyboards and battery charger!

Each "like-new" Portable Plus comes in its original packaging with new battery and new manuals. Personalized Software provides the one year guarantee.

*Crosswind Technologies has ported its
Synchronize workgroup time
management tools to HP-UX multiuser
host systems.*

(clients) from each user's X display station. Any multiuser minicomputers from the Series 800 or HP's new Series 9000 Model 635SV can run the X programs. The server must have at least 8 MB of (RAM).

The display stations (client machines) can be X terminals such as those in the new HP 700/x family of graphics terminals, any workstations that run HP-UX or another UNIX implementation, or personal computers.

Synchronize requires the latest release of HP-UX, Version 7.0, because this release is the first one that supports Version 11, Release 3 of the X Window System. A license for Synchronize costs \$100 per user with a minimum of five users.

Contact 6630 Highway 9, Suite 201, Felton, CA 95018; (408) 335-4988.

New SLAM/TESS Features Build Distribution

Pritsker Corp. announced the release of SLAM/TESS Version 4.0 that provides a fully integrated simulation environment supporting all phases of a simulation project.

Version 4.0 features distribution analysis capabilities, faster data collection and response time, context sensitive help and an interface to double precision simulation models, and runs on Apollo/Aegis.

Through its "build distribution" feature, Version 5.0 provides data distribution analysis capabilities. You now can characterize a raw data set or a histogram and fit one of 12

different distribution functions to the data. You can perform visual as well as statistical goodness-of-fit tests for the selected distribution through a menu-driven interface. Contact Pritsker Corp., Suite 500, 8910 Purdue Rd., Indianapolis, IN 46268; (317) 879-1011.

CIRCLE 375 ON READER CARD

Sybase Debuts First Open RDBMS

Sybase Inc. announced the first open relational database management system. The new release of the SYBASE SQL Server, Release 4.0, combined with Sybase's new connectivity product, SYBASE Open Server, offers capabilities to develop online applications that span multiple servers, integrate data and functionality from non-SYBASE sources, and provide a generic communication mechanism between clients and servers.

To support its open strategy, Sybase also announced new partners that endorse the SYBASE connectivity products, including the Open Server, as a standard for database client/server communication. The company also announced commercial availability of SYBASE Open Client on the Macintosh and the SYBASE system on several UNIX computers, including HP 9000 Series 300 and 800.

Contact Sybase Inc., 6475 Christie Ave., Emeryville, CA 94608; (415) 496-3500.

CIRCLE 374 ON READER CARD

Taurus Software Offers Database Archive Tool

Taurus Software announced WAREHOUSE, a database archive tool. WAREHOUSE uses a scripting language to allow you to define the groups of information from one or more datasets to be archived either to disc, tape or another database.

The information to be archived can be from one or more datasets either physically or logically related. During the archival you can update or delete records and/or print reports.

WAREHOUSE can be used for periodic cleanup of "stale" data from your database, creation of test databases, and simple data restructuring. Benefits include reduced disc space utilization, faster processing times because of fewer records to process and high-quality test databases.

The price ranges from \$3,000 to \$9,000 for the first copy depending on system size. Contact Taurus Software, 770 Welch Rd.,

When you think of memory, think of

MEGAMEMORIES™

Pile up your savings!

Nobody stacks up to HP when it comes to computers, and nobody stacks up to MARTINSOUND when it comes to memory for HP.

Buy your HP with the minimum memory complement, and buy your memory cards from us. Whether it's your first HP, your one-hundredth, or a system up-grade, the best buy in computers is HP and the best and most affordable memory is from MARTINSOUND. No one has more memory products and nobody can beat our prices.

SERIES 9000 (216, 217, 220, 226, 236, 237, 310 and 320)

- MS-310 1 Mb — The affordable alternative to the HP 1Mb board.
- MS-320 2 Mb — Twice the memory for less than the cost of a HP 1 Mb board!
- MS-340 4 Mb — The industry's best Mb-per-dollar value.
- MS-380 8 Mb — The ultimate slot-saver!

Model 350/370

Hi Comp Offers New Data Management Strategy

Hi Comp has worked with Hewlett-Packard Company to include the new rewritable optical disk drive subsystem, and other HP optical products as they become available, in our BACKUP software strategy to provide a single-vendor solution for NETWORK BACKUP.

The solution includes using the large online storage capacity for unattended operation on any HP 3000 or 9000 system with a user interface for MPE V, XL and HP-UX systems, and having the ability to store and restore data between all systems.

This new technology also introduces the option of the dedicated backup engine to cut costs and time by fully automating the backup process.

Contact Hi Comp America Inc., 305 Broadway, 4th Fl., New York, NY 10007; (212) 732-1946.

Customize Your HP-UX System With KLA/Express-9000

KLA & Associates announced the release of KLA/Express-9000, the HP-UX version of KLA/Express-3000.

KLA/Express-9000 is intelligence for the HP-UX scheduler/dispatcher allowing the user to customize the system based on his environment. KLA/Express-9000 allows the user to build his logic and thinking into the operating system.

The product allows the user to partition the executing queue and assign real-time and timesharing priority ranges for processes based on logon, terminal id and/or process name.

KLA/Express-9000 is menu-driven with over 4,000 lines of interactive help. It's priced from \$2,100 to \$3,700.

Contact KLA & Associates Inc., P.O. Box 14854, Clearwater, FL 34629-4854; (813) 784-5976.

Circle 360 on reader card

PC-EDIT/1000 Designed For HP MS-DOS Users

Paul W. Miller Inc. announced PC-EDIT/1000, an implementation of HP's Edit/1000 for MS-DOS users.

PC-EDIT/1000 is designed for those who work on both personal computers and HP 1000s. It takes advantage of the capabilities of the PC providing features currently not available on HP's EDIT/1000. These include left and right scrolling in screen mode, automatic screen and line mode tab compensation, automatic backup of the original file and screen mode brackets that can't be overwritten. The initialization file is executed every time PC-EDIT/1000 is run.

Single copy price is \$295.

Contact Paul W. Miller Inc., 27 Rambling Brook Dr., Holmdel, NJ 07733; (201) 946-0440.

Circle 356 on reader card

Ferret Technology Announces The Capacity Advisor

Ferret Technology announced The Capacity Advisor, a program that helps users select TurboImage master data set capacities.

Intended for use before a dataset unload/reload is done, The Capacity Advisor helps assure that master data sets are rebuilt with a reasonably minimal number of secondaries (synonyms) and clustering.

The Capacity Advisor executes as a nonprivileged program and opens databases in rad-only mode. It runs on all MPE and MPE XL systems. A PC version for use on flat files also is available for 286/386-based systems (with or without math coprocessors). Program licenses are available for \$295 per CPU, with site and multiple CPU options available. Contact Ferret Technology, P.O. Box 440, Corte Madera, CA 94925-0440; (415) 924-0584.

Circle 354 on reader card

MCBA Offers Financial Applications

MCBA Inc. has introduced its new 4th-generation language (4GL) based financial applications called the Resolution Financial System. The 4GL is targeted at cross-industry companies with general accounting needs and revenues in excess of \$50 million.

At the core of the Resolution System is the Resolution Environment and Shared Application Layer (REAL Software), which offers use of Oracle's SQL*Forms and SQL*ReportWrite by providing seamless integration between the two so that the user doesn't have to exit from one package to use the other.

Resolution applications will be priced from \$8,000 each, plus the cost of any Oracle tools required.

Contact MCBA, 425 West Broadway, Glendale, CA 91204-1269; (818) 242-9600.

IBM ↔ HP File Interchange

PCLIF is a software utility which permits the transfer of files between IBM PC's, PS/2's and HP technical (LIF) computers thru the exchange of floppy disks. Using the PC for 5.25" or the PS/2 for 3.5" transfers does not require additional hardware. An internal and an external 3.5" disk drive is available to allow the PC family to perform 3.5" disk transfers.

DB GENERAL

★ *Automatic capacity management*

DBGGENERAL monitors and changes dataset capacities automatically based on your configuration. Never worry about full datasets and changing capacities again.

★ *Dynamic detail set reorganization*

You can now stop and restart DBGGENERAL's detail set reorganization, and it will pick up where it left off. No more need to reserve several hours of exclusive access -- instead, run it for short periods whenever time is available.

★ *Global expert diagnostic*

Not only is this new diagnostic much faster and easier to use than anything we've ever offered, it also gives expert recommendations for solving the problems it detects - all it needs is the database name.

★ *Dynamic broken chain repair*

Broken chains are repaired in place with no path rebuild or unload/reload. There is no quicker method for fixing these and other critical problems.

★ *Single-pass structural changes*

From minor adjustments to major redesign, DBGGENERAL offers the most flexibility in database restructuring. Queue up changes or prepare a new schema, and even apply changes to multiple bases.

★ *Fast compressed tape backup*

DBGGENERAL's STORBASE module can reduce backup time from 35 - 50% and tape usage by 50% over conventional methods while retaining compatibility with transaction logging recovery.

★ *Optimum master capacity sampler*

DBGGENERAL includes a quick, simple, shared-access method for determining the optimal capacities for the best performance of your master datasets.

★ *Test database generation*

Stop testing programs and training users on production databases. DBGGENERAL can create small test databases with live data while keeping all relationships intact.

... and of course, 24-hour-a-day, 7-day-a-week technical support worldwide!

CIRCLE 108 ON READER CARD

Is someone in your office giving you the slip?

If you still rely on message slips and memos to move information through your office you may be missing something.

Opportunities.

You won't miss them with PostHaste.

PostHaste is an easy way to manage your personal communications with everyone in your organization.

With PostHaste you don't have to worry about lost or forgotten messages. You stay informed of important meetings and calls. It's simple to create phone messages, interoffice memos, reports, and send them along to the people you work with. Reflection users can even send large documents and HP 3000 or PC data files.

With PostHaste you get more done in less time. Because routing delays are virtually eliminated, your information is more timely. That means you can make decisions quickly and respond to opportunities as soon as they present themselves.

PostHaste runs on your HP 3000 and can be used from terminals, PCs emulating terminals, or MACs. You'll discover a host of features that allow you to create a communications system to perfectly match the way you do business.

Don't let another opportunity slip by. Call 800-872-2829 and receive PostHaste for a 90-day FREE trial.
